MEDICAL SCHOOL DEPARTMENT OF GENERAL PRACTICE

Robert A. Davison, M.D., Memphis, Tenn.

The general practice department of the University of Tennessee was developed on the premise that medical schools should give students some actual orientation and experience in the various forms of medical practice. The teaching of all the specialties has been traditional, but general practice, which is the most widely practiced of all fields of medicine, has been totally neglected. The established specialty clinics and medical services within the schools and teaching hospitals are highly departmentalized and in nowise resemble the conditions found in general practice. Further, in years past, the faculty of medical schools had, to a large extent, conducted general practices before specializing, but today practically none have had any experience with this form of medical care. Recognizing this, many medical schools have critically evaluated their curriculums with the purpose of offering some form of orientation and experience in general practice to the student. The specialty departments have developed and grown with the historical growth of the medical school, but there has been no such precedent set for the organization of a department of general practice. This has offered some problems in their establishment and the curricular position they should fill. The resulting curricular changes have included such teaching approaches as preceptorships, family care programs of varying nature and duration, general practice lectures, and general practice clinics.

At the University of Tennessee a large number of our students are interested in going into general practice, and we feel that this interest should be maintained and encouraged. Much too frequently the student enters medical school "social-minded and leaves lesion-minded." He is taught "how to attack a disease but not how to approach a patient." He examines a white female, age 30, gravida 3, para 3, rather than a 30-year-old white mother of three children. He enters medical school with the humanistic desire to treat people and alleviate suffering. He has never thought of patients as other than individuals in a family setting. Yet upon entering school he is soon taught to fractionate this "indivisible individual" into systems of anatomy and physiology, biochemistry and pathology. The patient soon loses her identity in the mind of the student and becomes a complicated and intricate assembly of organs and systems. To say to the new medical school applicant, "We must consider the patient as an individual with a family and social and economic environment" would seem to him a ridiculous stress of the obvious. But by the time he is a senior student he has been so thoroughly "brainwashed" that to consider the patient as other than a fleshy container for pathology too often seems unscientific and inappropriately idealistic. This we now recognize as a glaring danger in our teaching methods. Medical schools have been training medical scientists and biologists rather than doctors. The medical school should be a professional school as well as a technical school.

TEACHING THE FAMILY DOCTOR'S APPROACH

The student must be taught the humanities as well as the science of medicine. He must have firsthand experience in observing and evaluating the home and social environment in which disease finds its initial expression. The modern concept of preventive and curative medicine includes all phases of health and disease. To understand the total illness of a patient one must be familar with the socioeconomic environment in which it found its origin.[1] The family doctor's approach to sickness has been traditionally characterized by including all these factors, well leavened with understanding, compassion, and properly directed sympathy.

Recent trends in teaching at the undergraduate level express an interest in orienting students to the family doctor's approach to illness. Approximately two-thirds of our medical schools have developed preceptorships, general practice clinics, family care programs, and/or lectures on general medical problems oriented to the total medical care situation in an effort to widen the therapeutic perspective of the student. This is a result of a more total concept of illness being recognized by the faculty councils of our medical schools. The basic approach to practice as exemplified by the general practitioner as a family physician is being accepted as a sound and needed therapeutic approach long overdue in its curricular recognition. The family doctor

is not to be considered as a special type of medical sociologist who functions as a diagnostic agent for treatment centers elsewhere. He differs admirably and essentially from the almost strictly hospital and office specialist by his family orientation to illness. This difference has always been his birthright. It must be fully recognized that he is also a medical scientist qualified to completely manage 85% of the illnesses to which the public is liable, and the student must be encouraged and trained to properly fill this vital place in American medicine.

GENERAL PRACTICE CLINIC

In September, 1951,[2] the faculty council of the University of Tennessee approved the addition of a general practice clinic to the outpatient teaching curriculum. The attendance at this clinic, which is held during the last two quarters of the senior year, is required of all students. It was physically set up in the outpatient department division and staffed entirely by general practitioners. This gave the students an opportunity to associate with family doctors at the student-faculty teaching level and to observe their approach to patients. The student interested in going into general practice had for the first time a faculty advisor who was familiar with this field of medicine and who could broaden his knowledge and understanding of family medical care.[3]

Clinic Equipment.—The clinic is organized and equipped as a complete and self-contained unit in such a manner as to resemble the diagnostic and therapeutic facilities available in a good general practitioner's office. Separate examining rooms are equipped with examining tables, stools, chairs, and writing desk, permitting the student and patient total privacy during the history and physical examination. If, during the examination, certain laboratory procedures seem indicated, the clinic also has a small laboratory staffed with a technician through which these determinations can be obtained. Determinations not routinely done in the lab, but which may be indicated in the complete evaluation of the patient, are referred to other laboratories in the hospital, much as might be done in actual practice. The student is instructed in numerous diagnostic and therapeutic procedures that lend themselves to office practice. Time is taken in the clinic to observe the student while he actually applies what he has learned in his specialty lectures and clinics. An electrocardiogram is available for diagnostic confirmation on cardiac diseases when desired. A complete x-ray and darkroom unit is in the clinic, and the students are instructed in the taking of radiographs in a manner expected in office practice. A minor surgery room is also equipped for office surgery. Here, the students themselves, under the supervision of the staff, do biopsies, suture lacerations, and perform whatever procedures might be indicated. Diagnostic procedures such as sigmoidoscopy and indirect laryngoscopy are performed by the student when indicated. A microwave diathermy machine is available for indicated cases, and the student is instructed in its proper use. Many other procedures characteristically done in the general practitioner's office are demonstrated to, and done by, the student.

Purpose of Clinic.—One of the objectives of this clinic is to orient the student toward the total problems of his patient and how they bear on the cause of his disability and his response to treatment. An effort is made to make the student patient-oriented rather than disease-oriented. A maximum of 20 patients are selected for the clinic session each day. The selection includes five medical cases, five major or minor surgical cases, five gynecologic cases, three pediatric cases, and two dermatological cases. No effort is made to select patients with purely psychosomatic problems, but a high percentage of them have such conditions as an overlay of their disability. In this manner the student sees a good cross section of the types of illnesses with which the general practitioner is daily confronted. Too, unlike the other clinics, this clinic does not let the student know in advance of clinic hours whether his patients will present pediatric, gynecologic, medical, or other problems. He must correlate his specialty training to the problem at hand and adjust it to the needs of the patient. The student is required to do a complete history and physical examination within approximately an hour on all new patients. This does not include the time required for special diagnostic studies he may wish to do. Patients are given an appointment to return to the same student for follow-up care.

FAMILY CARE PROGRAM

The teaching objective of the department of general practice—the comprehensive medical care of the patient and his family—could not be fully met through the general practice clinic. It did not offer the student the opportunity to practice medicine in the home and to observe the environmental background of his patient's illness. To offset this deficiency, a family care program was added in May, 1952.[4] This program was designed to permit the student to see, live, and practice family medicine by assigning him a family for the last 12 months of his school curriculum. Equipped medical bags are made available to him for house calls, and the general practice clinic functions as his private office from 4 to 10 p. m. daily. He makes appointments with his patients for all examinations and treatments that lend themselves to office management. If necessary, he hospitalizes his patients and follows them while they are in the hospital.

Through these arrangements the student is more than just an observer; he functions in every manner as the family physician. He makes house calls and office appointments, determines the diagnosis, and institutes treatment, all under the intentionally unobtrusive but consistently present supervision of the general practice staff. Great effort is made not to destroy or attenuate the professional doctor-patient relationship established by the student. When the patient accepts the student as his family physician, the student realistically reacts to this

responsibility with an interest and enthusiasm not seen in his usual outpatient work. He becomes a private physician, keenly interested in all the factors that play a part in his family's medical problems. He becomes more than a medical scientist; he becomes a doctor, schooling himself in the art of medicine.

DOCTOR-PATIENT RELATIONSHIP

One hot day last summer student Eldridge was seeing one case of diarrhea after another in the pediatric clinic. He verbally expressed that he had seen enough diarrhea to last him for the next five years. When he got out of the clinic, a call from his "family" was waiting. The baby in the family had diarrhea. He immediately signed out a medical bag and hurried off to his house call saying, "That's my baby; I delivered it, and there's nothing going to happen to that kid." The small child in student Grogan's family had an accident and was brought into the emergency room. Student Grogan was in class at the time. The child was seen by the intern and the pediatric and orthopedic resident while its mother paced the floor. The child was admitted to the hospital, and the mother continued her restless steps. When student Grogan arrived, she was heard to comment, "Now that Dr. Grogan is going to see my baby and look after him, I can rest in peace. I'll go home and nurse the little one." The intern and residents meant nothing to her, but her family student doctor had developed a relationship that will not be soon forgotten by either. In the back row of the audience at graduation, a mother was seen holding a 6-week-old baby. Our medical-social worker recognized them as student Lunceford's family. She spoke to the woman. The woman explained, "My family doctor is graduating, and he delivered this baby, which was named Emmett Lunceford Jeans after him. When the baby gets older I want to be able to tell him that he went to Dr. Lunceford's graduation." Many such stories and instances come out of our family care program.

Once weekly, during both the 10th and 11th quarters, an informal family care conference is held, at which time the students discuss with the staff the preventive, therapeutic, and rehabilitative medical problems encountered during the course of their functions as family doctors. Smaller quarterly private conferences with a member of the staff are also held. Of course numerous "in the corridor" and "on the street" type conferences occur between the student and staff members. All the conferences and stories encouragingly demonstrate that we are accomplishing a patient-oriented attitude in the student; he is experiencing and learning medicine comparable to that which he will later practice. We feel that one of the important factors in the success of this program is allowing the student to assume supervised but full responsibility for the medical care of his family for a period of 12 months. If the student is allowed to be only an observer of the family environment, as his medical knowledge increases and the family's confidence in him enlarges, both will become frustrated because the student is not permitted to function as a truly helpful family physician. The doctor-patient relationship soon suffers to the point of not existing at all. The student becomes disinterested, and the family loses confidence in him; the whole stimulus for actively learning family medicine is lost. The situation becomes sterile of training value. This is the reason we believe the student should have the opportunity of diagnosing his patients' conditions and of treating his patients through home, office, and hospital arrangements.

FUNCTION AND VALUE

Our department of general practice, staffed entirely by general practitioners who hold university faculty appointments, is a completely autonomous department within the medical school, and credit for all courses offered by the department is required for graduation. The department's function is to supplement, not replace, the specialty teachings. Its value is in correlating and integrating the specialty training of the student in the overall care of the patient. The student comes to recognize the qualified general practitioner as a member of the profession, respected by his medical school as one qualified to teach and hold faculty appointments along with his specialist colleagues. He begins to view general practice as another field of medicine, honorable and worthy enough for his selection. He comes to know the background of disease through observing his patients for a full year in their natural environment. He is given an opportunity to correlate his technical knowledge of medicine with the natural setting of illness and to evaluate emotional problems of both children and adults from the vantage point of the family surroundings, which he comes to know well. He learns through experience the many factors that produce disease and retard healing.

874 Union Ave. (3).

Control of Eclampsia.—Toxemia of pregnancy has now displaced sepsis as the first cause of maternal mortality, and its severity is in some way linked with malnutrition, some of the worst cases occurring in those who are very undernourished; but other matters need consideration as well. The remarkable work reported by Hamlin (1952), from Australia, showing that eclampsia is largely a preventable disease, was partly the result of a most careful control of diet and weight gain in pregnancy; a low-carbohydrate and low-salt diet with a high protein and high vitamin content was an important aspect of the measures that were so successfully taken in Sydney to control this very serious disease. This was important work which showed the benefit that could result from close dietetic supervision of the pregnant woman. It is my view that we do not pay nearly enough attention to weight gain in pregnancy. A gain of 30 lb. (13.5 kg.) in the nine months should be the top limit of normal, and in many cases this figure should be substantially less—very much less if the patient is overweight. Some patients, indeed, should not gain any weight during pregnancy, and for these some reducing diet with sufficient of the essential food factors for the mother and her fetus may be required. Obesity in pregnancy is common enough and not without its dangers, especially if any active obstetrical or other treatment is required. Such patients may be very difficult to examine and, as a result, such conditions as mal-presentations, fetal abnormalities, pelvic tumors and contracted pelvis may be overlooked; the acute abdomen is more difficult to diagnose, anesthesia is more hazardous, and the operation and postoperative care more complicated. For over-weight patients a reduction in calorie intake, mostly by a reduction in carbohydrates, is indicated.—C. S. Russell, M.D., Diet in Pregnancy, *The Practitioner*, July, 1955.

STUDIES OF Rh SENSITIVITY AFTER REPEATED INJECTIONS OF SALK VACCINE

Neva M. Abelson, M.D., Robert M. McAllister, M.D., Arthur Greene, D.Sc.
and
Lewis L. Coriell, M.D., Philadelphia

In the last two years many physicians have been concerned that the repeated injection of Salk vaccine prepared from virus grown in monkey kidney tissue might sensitize the recipient to Rh antigens. Concern has been mainly for the Rh-negative girl who might become sensitized to the **D** factor, which is the most potent of the Rh antigens, but the question of possible sensitization of Rh-positive individuals to other blood factors also can be raised. Wiener [1] has stated that such sensitization could not occur because the Rh antigens in the monkey are slightly different from those in man. This reassurance has not satisfied the majority of physicians, and indeed it need not, for the question is subject to experimental study. Francis and associates [2] quote two investigators who found no Rh antibodies in 32 Rh-negative children (Milzer) and 2 Rh-negative laboratory workers (Frisch) who received poliomyelitis vaccine prepared from virus grown in monkey kidney tissue. This report also is not completely reassuring because injection of Rh antigen does not always evoke an immediate antibody response, though it may later promote erythroblastosis fetalis during a pregnancy with an Rh-positive fetus. The most sensitive method of measuring Rh antigenicity is to inject the material into an individual already known to be isoimmunized and to measure the subsequent antibody response. It is the purpose of this article to report a detailed study of the Rh antigenicity of Salk vaccine.

MATERIALS AND METHODS

The Rh antibody determinations were done by the saline-albumin, trypsinated red blood cell, and Coombs techniques. After the trypsinated red blood cell tests and Coombs tests were completed, albumin was added to determine if any of the reactions would be enhanced by the presence of a protein diluent. All titrations in any one series were carried out by the same technician and read by a second technician. All technicians working on this portion of the project had had at least five years' experience in the blood-grouping laboratory of the Philadelphia Serum Exchange, and their work was known to be reproducible within at least a twofold dilution. Multiple pipettes were used in making serum dilutions. Anti-**D** titers were checked against standards supplied to manufacturers of Rh typing serums by the Division of Biologics Standards of the Department of Health, Education, and Welfare, National Institutes of Health. The titers reported are those obtained with the indirect Coombs method, with the exception of the anti-**E** titers. In this case, the end-points obtained by the Coombs technique were not so clear-cut as the results in saline solution, and the latter are therefore reported. Poliomyelitis neutralizing antibodies were determined in stationary, slanted trypsinated monkey kidney tubes using 100 tissue culture doses of strains of Mahoney, MEF-1, and Saukett.

Field Trial Specimens.—The paired serums of 100 Morris County, New Jersey, children were tested for the presence of Rh antibodies. These children had received, in the spring of 1954, two injections of 1 ml. each of Salk vaccine (lot 506) at 0 and 7 days, followed by a 1 ml. injection of lot 307 vaccine at 35 days. The paired serums tested were the one drawn before vaccination and the one drawn one week after the third injection of vaccine. None of these children showed any Rh antibodies or Hr antibodies in the prevaccination and postvaccination serums. However, as already stated, such examinations do not provide adequate proof of the safety of the vaccine insofar as Rh antigenicity is concerned.

Antigens in Monkey Red Blood Cells.—In production of Salk vaccine, Macaca mulatta (rhesus) and Macaca irus (cynomolgus) monkeys are used interchangeably, because the kidney epithelial cells from both species grow in tissue culture and support the growth of poliomyelitis viruses equally well. Pooled, absorbed human blood serums prepared commercially for blood grouping and Rh testing were found to react selectively with certain of these monkey red blood cells, as shown in table 1. The erythrocytes of 77 animals received from Okatie Farms in the spring of 1954 were tested with different lots of human anti-**A**, anti-**B**, anti-**C**, anti-**D**, anti-**D**^{u}, and anti-**E** serums. Twenty-five additional animals were tested with anti-**c** and anti-**e** serums as well. As the results in table 1 indicate, there were 23 positive reactions with anti-**A** serum, 17 with anti-**C** serum, 16 with anti-**D** serum, and 21 with anti-**E** serum. There were no positive reactions with anti-**B** serum and none with anti-**c** and anti-**e** serums. If the monkey antigens were strictly comparable to human Rh factors, one would expect that at least the **E**-negative and **C**-negative cells would be positive to **c** and **e**. Moreover, many individual raw human serums will agglutinate red blood cells from rhesus and cynomolgus monkeys, regardless of blood group or Rh status. Therefore, results of such blood grouping tests as outlined above cannot be considered specific, and, although many of the blood specimens from monkeys used in vaccine production will cross react with human serums, the antigens, as Wiener [1] has stated, are different from those of man.

From the School of Medicine, University of Pennsylvania (Drs. Abelson, McAllister, and Coriell); the Children's Hospital (Drs. Abelson and Greene); the Woman's Hospital (Dr. Abelson); and the Camden Municipal Hospital, Camden, N. J. (Drs. McAllister and Coriell).

This study was supported in part by a grant from the National Foundation for Infantile Paralysis. The work done in 1947 to 1948, upon which a portion of this study is based, was supported by a grant from the National Institutes of Health, Public Health Service.

PLAN OF STUDY

The failure to find Rh antibodies in serums of children who have received Salk vaccine may be due to the absence of significant amounts of Rh antigen in the vaccine. On the other hand, a detectable primary response to Rh factors is not easy to evoke in man. When sensitization is done deliberately in Rh-negative males, repeated injections of blood are usually necessary before antibodies begin to appear, and occasionally an individual fails to develop antibody after many injections have been given over a period of months or even years. However, once a person is sensitized to Rh antigens, the heightened reactivity persists, as with other antigens, even after detectable circulating antibody has disappeared from the peripheral blood. In such cases, subsequent injection of Rh antigen stimulates an immediate recall of antibody. Injection of poliomyelitis vaccine into such sensitized individuals would be a more delicate method of detecting small traces of Rh antigens than trying to detect a primary response.

TABLE 1.—*Reactions of Macaca Monkey Red Blood Cells with Human Antiserums*

Monkey Species	No.	Antiserum A	B	C	D	D^u *	E	c †	e †
Cynomolgus	35	8	0	0	2	0	0	0	0
Rhesus	67	15	0	17	14	0	19	0	0
Total	102	23	0	17	16	0	19	0	0
% positive		22.5	0	16.7	15.7	0	18.7	0	0

* Only **D**-negative specimens were tested with anti-D^u serum.
† 25 animals tested with anti-**c** and anti-**e**.

Two different groups of Rh sensitized individuals were available for study. The first group (A) was comprised of two women and six men. The women had been sensitized through blood transfusion and pregnancy and had been sterilized. The men had been sensitized through blood transfusion and subsequent injections of Rh-positive red blood cells. One of the men had had no injections of blood for four years; the remainder of the group had had injections of Rh-positive red blood cells within the preceding year. Four of the eight members of the group were sensitized to **D**; two to **C** + **D**, and one to **D** + **E**. The second group of individuals was composed of 16 men who had received repeated small injections of Rh-positive blood in 1947 to 1948. Thirteen of the 16 were known to be sensitized to Rh factors. Seven were sensitized to **D** and six to **C** + **D**. They had never received **E**-positive blood. Three of the men were not known to be Rh sensitized. These 16 individuals were divided into two further groups (B) and (C). Each group contained eight men. Of the eight men in group (B), two were sensitized to **D** and four to **C** + **D**. Of the eight men in group (C), five were sensitized to **D** and two to **C** + **D**.

Each of the three groups, (A), (B), and (C), received a different lot of Salk vaccine. Three 1 ml. intramuscular injections were given at intervals of 0, 7, and 35 days. Blood was drawn before the first dose and at regular (usually weekly) intervals for at least nine weeks. Vaccines were selected to give information on the product of three companies. The virus for lots 502 and 309 vaccine was grown at the Connaught Laboratories, Toronto, Canada, for the National Foundation for Infantile Paralysis, using a mixture of minced monkey kidney, growth medium, and virus in a Povitsky bottle that was continuously rocked on a shaking machine and harvested at the time of maximal virus yield. The formaldehyde solution N. F. (Formalin) inactivation of virus, testing, and bottling were done at Parke, Davis & Company, Detroit, in the case of lot 502 vaccine, and at Eli Lilly & Company, Indianapolis, in the case of lot 309 vaccine. The virus for lot 202 was grown and processed by the Wyeth Laboratories, Inc., Philadelphia, in bottles containing glass wool that permitted washing of the growing kidney cells three times to remove red blood cells and tissue debris before the seed virus was added to the bottles. This was the first commercially produced lot of Salk poliomyelitis vaccine. In table 2 the protein analysis of these three lots is presented. There were no significant differences among the results for the three lots.

The Rh antibody titers of group (A) before and following vaccination with lot 502 are presented in table 3. Seven of the eight individuals who received lot 502 vaccine still had detectable Rh antibody titers at the time of vaccination. After the injection of the vaccine, there was some Rh antibody rise in all of these individuals. Two showed at least a fourfold rise of anti-**C** titer, and all seven showed at least a fourfold rise to **D**^{u}. The one volunteer sensitized to **E** showed a twofold rise in anti-**E** titer, but this difference was within the range of technical error. The rise was most marked in the anti-**D**^{u} titers. One individual who received lot 502 vaccine (case 8) had not responded to previous attempts at Rh sensitization with whole blood, and he did not respond following the administration of poliomyelitis vaccine. After the follow-up period each of these volunteers was given a small injection of Rh-positive blood. There was no further detectable antibody response.

TABLE 2.—*Protein Assay of Poliomyelitis Vaccine, Milligram Per Milliliter*

Lot No.	Amino Nitrogen	Total Nitrogen	Nonprotein Nitrogen	Protein Nitrogen
309	0.064	0.216	0.176	0.040
502, sample 1	0.070	0.153	0.147	0.006
502, sample 2	0.070	0.155	0.143	0.009
202, type 1 *	0.058	0.151	0.113	0.038
202, type 2 *	0.065	0.166	0.115	0.051
202, type 3 *	0.095	0.159	0.113	0.046

* The results for lot 202 vaccine are presented on the three separate strain pools. The finished vaccine was made by combining equal parts of each virus type.

None of the eight volunteers who received lot 202 vaccine showed a significant rise of Rh antibody titer immediately following vaccination or in the nine-week follow-up period (table 3). One of the eight volunteers who received lot 309 vaccine had a rise of anti-**C** titer from 1:2 to 1:4, but this small change is not significant; neither is a change of 0 to U (undiluted) (table 3). With lots 202 and 309 vaccine, therefore, there was no evidence for the presence of Rh antigens. However, some explanation is necessary for the apparent response to lot 502 vaccine. This response might be due to the presence of Rh antigen in the vaccine, or it could be an anamnestic reaction. The latter explanation is made more likely by the fact that the group of volunteers used

for testing lot 502 vaccine had been more recently sensitized than the other two groups, and most of them still had fairly high Rh antibody titers at the time they were given the poliomyelitis vaccine. As shown in table 3, these individuals developed a rise of Rh antibody only for antigens to which they already had circulating antibodies at the time the vaccine was given. The antigenicity of lot 502 vaccine was therefore retested by giving a series of three injections of this vaccine to each of the 16 volunteers who had previously been given lots 309 and 202 vaccine. Each of the 16 men received 1 ml. of lot 502 vaccine on Feb. 10, Feb. 17, and March 17, 1955. Blood was drawn for antibody determinations on Feb. 10, March 10, and March 31, 1955. All tests were negative for antibodies or only weakly positive, and there was no significant rise of antibody titer.

stimulus. Note also the anamnestic response to **C** in the two men who had previously had anti-**C** titers. Though the blood given was **E** positive, no anti-**E** agglutinins appeared in this group, which had not previously received **E**-positive blood. Another previously sensitized man, with a residual anti-**D** titer of 1:8, was given a series of five injections of lot 502 vaccine over a six week period. His anti-**D** titer varied between 1:8 and 1:16 over this period. After a one month rest period, he was given 0.25 ml. of **D**-positive blood. His anti-**D** titers two and three weeks later were 1:128 and 1:512, respectively, showing that he, too, was capable of responding to the specific antigenic stimulus, though he did not respond to injection of lot 502 vaccine.

Additional studies with lot 502 vaccine were designed to show whether repeated injection of the vaccine, while

* Each recipient received three injections. † U = undiluted.

These tests strongly suggested that there was no Rh antigen in lot 502 vaccine and that the response previously noted was, in fact, an anamnestic reaction in volunteers who already had considerable residual circulating antibody. An alternative explanation might be that the volunteers used for lots 309 and 202 vaccine had lost their hypersensitivity by reason of the long interval since their original sensitization to Rh antigens—a period of seven or eight years (table 3). This hypothesis was put to test by selecting 5 of the 16 men at random for an injection of Rh-positive blood. On April 21 these five received intravenously 0.25 ml. of a 50% suspension of whole **DE**-positive, **C**-negative human red blood cells in acid-citrate-dextrose solution. Antibody titers two weeks later (May 5) were elevated, as shown in table 4. It is obvious that each man promptly produced a high titer of Rh antibody and thereby demonstrated the ability to respond to a specific antigenic

not capable of stimulating Rh antibody production, might still be able to alter the reactivity of the host so that he would later respond more quickly to the injection

of whole blood. For this study five Rh negative volunteers who had not been previously sensitized were given 1 ml. intramuscular injections of lot 502 vaccine at

weekly intervals over a period of two months. Such a procedure, using whole blood, would be expected to sensitize at least 50% of Rh-negative volunteers. No Rh antibodies appeared. After a rest period of one month, two of the five were given 0.25 ml. of whole **D**-positive blood. After a rest period of six weeks, the third man was given whole blood. A fourth volunteer was given whole blood after a rest period of eight weeks. The fifth volunteer was not available for completion of these studies. No anti-**D** agglutinins were detected in the serums of these men two to four weeks after administration of blood.

The serums of the men who were not Rh-sensitized were also tested to see if there had been any stimulation of anti-**A** or anti-**B** production. No significant change was found. Comparative titrations were also done to determine if there had been any alteration in reactivity to monkey red blood cells. None was found. Most of the numerous serum samples from these volunteers have been tested for poliomyelitis neutralizing antibodies against types 1, 2, and 3. The results are of some interest in evaluating the apparent anamnestic responses and may be summarized briefly. All lots tested stimulated the production of poliomyelitis antibodies. Lot 502 vaccine was weakest, followed in order of increasing potency by lots 506, 307, 202, and 309.

COMMENT

Some of the vaccines used in these experiments were made by procedures that permitted incubation of monkey kidney fragments and red blood cells at 36 C (96.8 F), with agitation, for over one week. Since the exact nature of the Rh antigen has not yet been determined, it could be postulated that some of these cells might disintegrate and release their antigens into the liquid phase, pass through subsequent filtration, and appear in the final vaccine. Since the exhaustive tests described here failed to disclose Rh antigenicity in the vaccines made and processed by varying techniques, one can assume that they are either removed by the processing or that they are so unrelated to human Rh antigens as to be inconsequential, as Wiener originally stated. In fact, the studies suggest that both assumptions may be correct. At any rate, it seems probable that there is no danger of Rh sensitization of man by the Salk vaccine.

SUMMARY

A certain number of blood specimens from monkeys used in production of Salk poliomyelitis vaccine cross react with serums of human origin. These cross reactions, while not typical of human red blood cells, suggest the possibility of Rh antigenicity of the Salk vaccine. Therefore, the vaccine was subjected to detailed investigation with the following results. 1. The paired specimens of 100 children inoculated in the field trials with two different production lots of poliomyelitis vaccine contained no Rh antibodies. 2. Three production lots of Salk vaccine were injected into previously sensitized Rh-negative volunteers who had little or no residual circulating Rh antibody. No significant antibody response was observed. The hypersensitivity of these volunteers was later demonstrated by injection of whole Rh positive blood. 3. Rh negative nonsensitized volunteers received many injections of one vaccine lot followed by whole blood after a rest period. No sensitization by the vaccine was demonstrated. The tests used for this study are the most sensitive tests for the presence of Rh antigens that can be devised or imagined in the present state of knowledge, and they do not show even a trace of Rh antigens in the lots of Salk vaccine tested.

VACCINATION-INDUCED POLIOMYELITIS IN IDAHO

PRELIMINARY REPORT OF EXPERIENCE WITH SALK POLIOMYELITIS VACCINE

Lawrence J. Peterson, M.S.P.H., Woodrow W. Benson, M.P.H.
and
Frederick O. Graeber, M.D., Boise, Idaho

This report is intended to present evidence confirming the presence of live virus in the poliomyelitis vaccine made available by the National Foundation for Infantile Paralysis for the inoculation of first and second grade school children in Idaho in the spring of 1955 and to present in a factual manner the impact that the use of such a vaccine has had on the state. The Francis report was accepted in Idaho as sufficient evidence that the Salk poliomyelitis vaccine was safe and potent. The vaccination program began in Idaho on April 19 and was discontinued on April 27. During that period approximately 32,000 first and second grade children received one injection of vaccine produced by Cutter Laboratories. Two lots of vaccine were used, E6058 and E6039.

From the Idaho State Board of Health, Division of Public Health.

Two cases of poliomyelitis were reported in Idaho on April 26, one resulting in a fatality. It was thought, of course, that some of the vaccinated children by chance alone would be developing poliomyelitis during the vaccination period, and these two cases at first were believed to be coincidental. On the morning of April 27, a report was received that in California cases of poliomyelitis were occurring in children who had received an injection of the vaccine, and later in the day information was received that the Cutter Laboratories had been asked by the United States Public Health Service to recall all of its poliomyelitis vaccine. Subsequent evidence has indicated that the vaccine that was used in Idaho contained live poliomyelitis virus. Some of the evidence in support of this viewpoint is presented in the following sections.

INCIDENCE OF CASES

Cases in Vaccinated Persons.—Within 26 days after the beginning of vaccination, 20 vaccinated children had developed clinical poliomyelitis, for an attack rate of about 1 to 1,600 injections. The average period of time between inoculation and clinical symptoms was 11.3 days, with a range from 5 to 26 days. Three of these children died, for a case fatality rate of 15%. Of the 20 patients, 11 showed paralysis in the arm of injection. Generally speaking, these 20 children had upper body paralysis, as compared to the usual predominance of lower body paralysis expected in this disease. The clinical impression of the examining physicians was that these 20 children were more severely involved than would be expected in an ordinary outbreak of the disease.

Objections were raised at first that, if all or almost all of the vaccine contained living virus, many more than 20 of the 32,000 children should have developed clinical

poliomyelitis. This lack of an explosive outbreak is best explained on the basis of the unnatural method of infection by intramuscular injection.[1] A similar incidence of infection was observed by Kolmer in 1935 after the use of his live virus vaccine. Two other vaccinated children have developed clinical poliomyelitis. In these two cases the time elapsing between inoculation and clinical symptoms was 47 days and 90 days respectively. Because of the long interval between inoculation and illness, it is believed that these two children did not acquire poliomyelitis directly as a result of the vaccination. The only basis for this belief is the meager information available from monkey experiments. Monkeys inoculated intramuscularly with live Mahoney strain virus have an incubation period from 6 to 25 days.[2] It is possible that these two children developed no antibodies from the vaccine that they received. Table 1 gives some of the pertinent data concerning these 22 cases that occurred after vaccination.

Cases Resulting from Familial Contact.—On May 12, the first case resulting from familial contact was reported and, as further cases developed, it became apparent that

* Died.

persons outside of the immediate family were contracting poliomyelitis as a result of contact with vaccinated children. By June 14, excluding cases in vaccinated persons, there had been 53 cases of poliomyelitis reported with onset occurring after the cessation of the vaccination program. In these 53 cases, 45 persons had well-established close contact with vaccinated children. Table 2 illustrates this relationship.

195

LABORATORY FINDINGS

Virus Isolation (Human).—Poliomyelitis virus has been isolated from the throat and stool specimens from 181 individuals. Only type 1 virus has been found. Virus has been isolated from vaccinated children who developed the disease, from vaccinated children who did not develop the disease but had a minor illness shortly after inoculation, from vaccinated children who showed no overt effects, from family contacts of children in all three of these categories, and from individuals who apparently had not been exposed to a vaccinated child nor to an individual given a diagnosis of poliomyelitis. It might be assumed that, if the outbreak of poliomyelitis that occurred was of natural origin, an occasional type 2 or type 3 virus should be found.

* Aged 6, 7, 8, and 9.

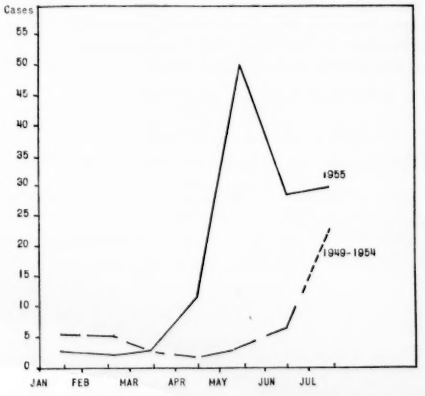
Virus Isolation (Animal).—On June 1, it was reported that Dr. Louis P. Gebhardt at the University of Utah Medical School had been successful in producing clinical poliomyelitis in a monkey injected with vaccine from lot number E6058. On June 15, Dr. Carl Eklund at the United States Public Health Service Laboratory in Hamilton, Mont., reported the isolation of type 1 virus from monkeys injected with the vaccine. Monkeys inoculated with vaccine from lot E6058 and lot E6039 developed clinical poliomyelitis. When autopsy was done, these monkeys showed typical microscopic evidence of poliomyelitis. Spinal cord emulsion produced growth on tissue culture in seven days, and type 1 virus was isolated from these cultures.

Virus Isolation (Tissue Culture).—On July 7, Dr. Eklund reported that tissue culture study of lot E6058 showed necrosis in 1 out of 50 test bottles used (500 cc. of vaccine was tested) and that this positive bottle showed type 3 virus. The isolation of type 3 virus was unexpected because all of the previous isolations, without exception, were type 1. The only apparent explanation of this phenomenon is that type 1 virus, because of superior growth qualities, masked the presence of type 3 virus. Frozen stool specimens obtained early in the study and additional vaccine are being restudied to see whether type 2 or type 3 virus can also be isolated.

Antibody Response.—A study of antibody response to the one injection of vaccine in a representative sample of the children receiving the vaccine has indicated that very high levels of antibody were obtained. In 160 consecutive blood specimens thus far analyzed from samples drawn approximately six weeks after inoculation in the Bannock County–Bingham County area, 78.8% of the children showed neutralizing antibodies to type 1, 86.8% to type 2, and 71.2% to type 3. Of the 160 children, 127 had an antibody titer of 1:1024 to one of the three types, 54 had an antibody titer of 1:1024 to two of the three types, and 8 children had an antibody titer of 1:1024 against all three types. Nine children showed no neutralizing antibody readings to any of the three types. The 1:1024 dilutions will later be run out to their endpoint. In table 3 there is given a summarization of the antibody status of the 160 children. The fact that these children have developed high antibody titers against all three types is additional evidence that the vaccine used in Idaho contained living type 1 and 3 virus and, in all probability, also contained live type 2 virus. The antibody response in these children who received one inoculation far exceeds the level reached in Idaho children in the field trial vaccine program of 1954, after three inoculations over a five week period.

IMPACT ON THE STATE

The first result of the vaccination program was the occurrence by May 14 of 20 cases among vaccinated children. In the past six years a total of only 16 cases of poliomyelitis had been reported through the end of May in children aged 6, 7, and 8. The greatest number occurring in any one of these years was four cases. The second effect was the occurrence of an unusually high incidence of cases in all age groups prior to the usual poliomyelitis season. From Jan. 1 to July 1, 100 cases of poliomyelitis were reported. In the six years from 1949 to 1954, there had been an average of 27.2 cases reported by the first of July. Two of these years, 1949 and 1952, were years of unusually high incidence of the disease. The year of highest incidence during this period was in 1949 when 48 cases occurred. The graph shown in the figure, comparing the number of cases by month this year with an average for the past six years, illustrates this difference in time of seasonal occurrence. The third observation was the fact that, whereas, in previous years the poliomyelitis occurring in the state has usually seemed to start in one of the trading areas and has then moved around the state in a somewhat haphaz-



Average number of poliomyelitis cases reported in Idaho for the first part of 1949-1954 compared to 1955.

ard manner, this year poliomyelitis cases have occurred almost simultaneously and uniformly over the entire state. There has been no area in the state that has had a disproportionate share of cases, if population density is considered.

CONCLUSIONS

Poliomyelitis vaccine used in a mass inoculation program in Idaho in 1955 contained live virus. The first result of the use of such a vaccine was to cause a wave of cases in vaccinated children. The second result was the occurrence of a wave of cases in the contacts of vaccinated children. The widespread isolation of poliomyelitis virus and the uniform distribution of cases indicate that the state has been heavily seeded with virus prior to the normal poliomyelitis season. The effect of this early, unnatural seeding is unpredictable. (The total number of cases as of Aug. 1 was 130.)

PERINATAL MORTALITY

Edwin M. Gold, M.D., Brooklyn, N. Y.

Perinatal mortality is a relatively new term. In 1948, Peller [1] felt that there was such a close association between fetal death ratios and neonatal mortality rates that he suggested their combination into a "perinatal mortality rate." Baumgartner and Erhardt [2] have reiterated the validity of this concept. The World Health Organization Expert Committee on Health Statistics in 1950 [3] recommended that the fetal death and neonatal mortality statistics be published alongside of each other so that they could be considered as a unit. Davis, Potter, and Bruce [4] referred to perinatal mortality as an inclusive term to include stillbirth and neonatal mortality. Obstetricians should think of perinatal mortality as expressing loss of life just before, during, or just after birth, since these are areas of prime obstetric responsibility. Therefore, in New York City a perinatal mortality rate is obtained by the following formula:

$$\frac{\text{Infant deaths (under 1 week) plus fetal deaths (28 weeks and over)}}{\text{Live births plus fetal deaths (28 weeks and over)}} \times 1{,}000$$

This formula reveals perinatal mortality to be composed of infant deaths (under one week) and late fetal deaths (over 28 weeks' gestation). The vital statistics of New York City for the years 1946 through 1953 (table 1) indicate a decline in the perinatal mortality rate of 19.5%. The late fetal deaths (28 weeks and over) declined 28.0%, and the early infant deaths (under 7 days) declined 12.0%. This represents improvement, though not as rapid improvement as is noted in the decline of the maternal mortality rate of 44.4% for the same period.

EARLY INFANT DEATHS AND THEIR CAUSES

Since the early infant deaths declined least, (12%), let us examine them first to see why. They comprise 90% of the infant deaths in the first month of life, and over 50% of them occur on the first day of life. More noteworthy is the fact that 90% of the early infant deaths are due to perinatal causes; namely, prematurity in 51%, birth injuries and malformations in about 15% each, and anoxia and erythroblastosis in 11%.

Prematurity.—Prematurity, accounting for half the neonatal mortality in New York City and 79.1% of natal day deaths in Chicago,[5] is a formidable cause of early infant deaths. The incidence of prematurity in New York City during the years 1946 through 1953 has remained fairly constant at a level of 8.1% of all live births, with an incidence of 7.5% in the white as against 11.5% in the nonwhite population. To reduce the early infant death rate further and more rapidly than heretofore, prematurity must of necessity be prevented and treated. The clues to reduction of prematurity should be the relationships that have been shown [6] between age, parity, socioeconomic conditions of the pregnant woman, and quality of prenatal care with the incidence of premature birth.

Recent confirmatory studies in New York City,[7] based on the criteria developed from birth certificate data, have pointed out that prenatal care is started late (in the last trimester of pregnancy) in certain groups of pregnant women: the nonwhite patients in general; women under 20 and especially multiparas under 20; patients delivered in municipal hospitals; Negro patients delivered on ward services of voluntary hospitals; and patients delivered at home. All these data reveal a need to assure early and continuous prenatal care of all pregnant women, but especially among the priority

groups mentioned. This is an area where maternal and child health services of municipal health departments can work hand in hand with the obstetrician, the hospital, and other community agencies to locate such priority groups of patients and assure their early and continuous care as one major means of reducing the incidence of prematurity.

Therapeutically, the most current, sound obstetric principles of management and care of the patient in premature labor and during premature delivery should be applied. Particular emphasis should be placed here on the conservative management of the patient with premature rupture of the membranes; she should be hospitalized and no attempt made to induce labor. Placenta previa should be treated expectantly to insure viability of the fetus. Cases of Rh and AB isoimmunization should be carried to full viability before the pregnancy is terminated. Finally, the recently summarized principles [8] of management of the premature labor and delivery should be continuously disseminated and stressed.

proprietary hospitals, 39.9% of the patients were delivered by midforceps, 62% by breech, 37.5% by internal podalic version, and 25% by cesarean section without a qualified obstetrician in attendance. Thus, it is timely to reiterate that each maternity service should provide a qualified chief of service and that this chief should set up and enforce consultation policies in the interest of lowering the incidence of birth injury.

Malformations.—There is not much that can be constructively stated about malformations except that their incidence remains stationary at about 1.5% of all births. About 15% of early infant deaths are directly or indirectly ascribable to this cause. The solution to the problem of lowering incidence of malformations lies in further research in the fields of environmental pathology and the influence of nutrition on the developing fetus in the first eight weeks of intrauterine life. The role of viral diseases in the first 12 weeks of gestational life in producing malformations is becoming more definite, though not particularly well understood. Prophylaxis therefore still stands in abeyance.

TABLE 1.—*Changes in Perinatal Mortality Taken from the Vital Statistics of New York City from 1946 to 1953*

	1946	1953	Percentage of Change
Live births	152,736	161,499	.....
Infant deaths (under 1 yr.)	4,239	3,945	.....
Infant death rate (per 1,000 live births)	27.8	24.4	(—) 12.2
Neonatal deaths (under 1 mo.)	3,279	2,945	.....
Neonatal death rate (per 1,000 live births)	21.5	18.2	(—) 15.3
Early neonatal deaths (under 7 days)	2,804	2,623	.....
Early neonatal death rate (per 1,000 live births)	18.4	16.2	(—) 12.0
Fetal deaths	12,980	19,357	.....
Fetal death ratio (per 1,000 live births)	85.0	119.9	(+) 41.1
Fetal deaths (28 weeks and over)	2,947	2,239	.....
Fetal death ratio (per 1,000 live births)	19.3	13.9	(—) 28.0
Perinatal mortality	5,751	4,862	.....
Perinatal mortality rate	36.9	29.7	(—) 19.5
Maternal mortality	179	105	.....
Maternal mortality rate (per 10,000 live births)	11.7	6.5	(—) 44.4

Birth Injury.—Birth injury is the second major cause of early infant mortality in New York City. The incidence of reported severe birth injury for the year 1948 in New York City was recently reported [9] as 1.7 per 1,000 live births. This study showed the relation of type of delivery to reported severe birth injury. The reported severe birth injury rates per 1,000 live births were 0.21 in spontaneous delivery and 1.3 in low forceps and cesarean section but jumped to 30.0 with version, 17.5 with high forceps, 14.4 with midforceps, and 14.0 with breech delivery. This study also pointed out that, despite recommendations of the Advisory Obstetric Committee of the New York City Health Department that consultation with a qualified obstetrician be required in all obstetric operations other than low forceps delivery, the facts showed otherwise. In the reported cases of severe birth injury occurring on the ward services of the municipal and voluntary hospitals, 60% of the midforceps and 85% of the breech deliveries were performed by the house staff without a qualified attending obstetrician in attendance. In the reported cases of severe birth injury on the private services of voluntary and

Erythroblastosis and Anoxia.—Together, erythroblastosis and anoxia account for 11% of early infant deaths in New York City. Deaths due to Rh incompatibilities and AB isoimmunization factors may be related to the thoroughness of antepartum diagnosis and the preparations in the immediate puerperium for coping with them. The anoxia cases in this group are associated with prolonged labor, operative delivery, and hemorrhagic complications at or near term, such as abruptio placenta, placenta previa, marginal sinus rupture, and other hemorrhage. Better obstetric management, more liberal use of consultation, skilled obstetric care for operative delivery, and temporizing in the management of placenta previa with liberal recourse to blood replacement as needed are contributing to reduction of early infant loss from these causes. In addition, increas-

ing awareness of the role the qualified anesthetist plays in bringing new conduction and regional anesthetic techniques into the delivery room and his growing role in supervision of neonatal resuscitation will further tend to decrease infant loss from anoxic causes. Adherence to such a policy is a potential in reducing anoxic complications as a major cause of early infant deaths.

Before the second component of perinatal mortality is analyzed—late fetal deaths (28 weeks and over)—it should be noted in table 1 that fetal death ratio (all fetal deaths) has risen 41.1% during the years 1946 through 1953 and the upward trend was continuous. This is ascribable to the increased reporting of early fetal deaths, particularly in the under-20-week group. The late fetal deaths (28 weeks and over) have fallen 28% during this eight year period. Numerically they represent approximately half of the perinatal deaths herein defined, the other half being the early infant deaths. This leads to a conclusion that possibly, by

Ill-defined and unknown causes	1,017		41.6	

improvements in prenatal care and improved nutrition, together with improved techniques of coping with the complications of early pregnancy, more fetuses are now being carried beyond the 28th week and delivered alive. In other words, more "poor risk" infants are brought into the early neonatal period, thereby accounting for the relatively slower improvement of the early infant death rate, which declined only 12%.

LATE FETAL DEATHS AND THEIR CAUSES

The late fetal deaths (over 28 weeks), the other component of our perinatal mortality, represent slightly more than 10% of the total fetal deaths per year in New York City but approximately 50% of the perinatal mortality. These are the antepartum and intrapartum intrauterine deaths.

Table 2, listing the reported fetal deaths at 28 weeks and over by cause of death for the year 1952 in New York City (the latest year of complete tabulation of late fetal deaths by cause), shows three major groups by cause.

Maternal Causes and Conditions.—Maternal conditions represent 20.4% of the total. Of these causes, toxemia represents 50%, abnormal labor 20%, and chronic diseases (such as diabetes, syphilis, and vascular and renal diseases) another 20%. Toxemia of pregnancy and chronic diseases of the mother represent a challenge in relation to prenatal care. The same factor of implementing prenatal care, particularly in the priority group of mothers alluded to in discussion of early infant deaths, is applicable here.

Causes in the Fetus, Placenta, and Cord.—Conditions in the fetus, placenta, and cord represent 38% of the late fetal deaths. Of these causes, premature separation of the placenta represents 29%, other placental and cord conditions 39%, congenital malformations 18%, and erythroblastosis 10%. If the high association of premature separation of the placenta with toxemia, the high association of other placental conditions, such as infarction, fibrosis, and degeneration with the vascular and renal complications of pregnancy, and the role of antepartum casefinding and preparation in relation to erythroblastosis are considered, the import of adequate antepartum care as the theoretical potential in lowering the incidence of late fetal deaths from these causes can again be recognized.

Ill-Defined or Unknown Causes.—Of paramount interest is that in 41.6% of the late fetal deaths the cause was ill-defined or unknown. Hughes and Schoeneck [10] have stated that, if a woman had a premature delivery, stillbirth, or abortion in one pregnancy, she had a better than average chance of difficulty in future pregnancy. On these grounds they recommended preconceptional evaluation of prospective parents with a history of previous unsatisfactory pregnancies. Such evaluation would be done in preconceptional clinics. Aaron, Levine, and Gitman [11] on the basis of experiences in such a clinic emphasize the need for further study of the uterine environment, the endometrium, and uterine anomalies because of the importance of these factors in repeated pregnancy wastage.

In New York City at present, the autopsy rate in late fetal and early infant deaths ranges between only 25 and 40%. In Chicago, on the other hand, autopsies are being performed on approximately 85% of all dead infants.[12] Thus a vital source of information as to anatomic cause of perinatal mortality in New York City is being sadly neglected. A pertinent recommendation would be to increase autopsy percentages at the individual hospital and community level. These autopsies in both late fetal and early infant deaths should be done promptly, by specially trained pathologists, and the results collated with the clinical course of the mother so that the findings would be more meaningful. Another suggestion would be to stimulate the development of "perinatal mortality conferences" at hospital level at which the obstetrician, pediatrician, anesthetist, and pathologist could pool their knowledge during the case study. Much information of a preventive and therapeutic nature can come from such an approach. Apply-

ing this same technique on a community level, we should stimulate the development of perinatal mortality committees patterned after the maternal mortality committees that have so materially aided in the reduction of maternal mortality in this country by eliciting the errors of omission and commission, from which the current recommendations of good obstetric practice have emanated.

CONCLUSIONS

In conclusion then, we have attempted to focus attention on the fact that perinatal mortality is composed of early infant deaths (under 7 days) and late fetal deaths (over 28 weeks), both areas where obstetric responsibility is high and the problems of which are inseparable. In order to speed up the decline in perinatal mortality, continued effort in the following areas is suggested. 1. In preconceptional care the effort should be to investigate families with a history of pregnancy wastage in the interval between pregnancy, to delve deeper into the realms of environmental pathology, and to increase research in the role that endometrial insufficiency and uterine anomalies play in pregnancy wastage. 2. In prenatal care attempts should be made to identify, locate, and give early and continuous high quality prenatal care to all pregnant women but especially to those in low socioeconomic strata, nonwhite patients in general, women under 20, and especially multiparas under 20. 3. Those concerned in intrapartum and postpartum care should disseminate and apply currently accepted standards of skilled obstetric and anesthesia care in all deliveries and especially in premature deliveries. Qualified consultation in obstetric and newborn infant practice should be used freely. An attempt should be made to raise the numbers and quality of autopsies performed at the hospital and community level to permit better evaluation if possible of causes of perinatal mortality on an anatomic basis. 4. Perinatal mortality committees should be further developed, patterned after the preexisting maternal mortality committees. Such committees should represent joint cooperation of the county medical society and the local health department.

47 Plaza St. (17).

Tuberculin Testing.—In spite of many studies of its value, many physicians still neglect the tuberculin test when the differential diagnosis of a pulmonary lesion is considered . . . [because] there seems to be a feeling that "since nearly every adult is tuberculin-positive, there is little reason to do the test." . . . Newer procedures in diagnosing lesions of the lungs are stressed . . . [and] the physician may become involved in the intricacies of the new tests rather than attempt to evaluate his patient on the basis of tried and true ones. . . . [Also] the present-day treatment for tuberculosis has become so simplified, with such a low percentage of toxic or ill effects, that the temptation is very great to start treatment before clinching the diagnosis. . . . The trend toward ambulatory care of tuberculosis hastens the feeling that treatment should be started just as soon as a pulmonary lesion is found. Nevertheless, the physician must not forget that the diagnosis of tuberculosis carries with it great social, economic, and physical responsibilities. . . . He must make the diagnosis with great certainty and caution. . . . The tuberculin test is a simple, cheap, and comparatively short test in which the possibility of a lesion being tuberculous can be ruled out. . . . It is one that has stood the test of time, and . . . it has not been supplemented by new and more intricate methods. It will become more valuable as our control of tuberculosis improves.—D. Jackson, M.D., The Value of Tuberculin Testing, *A. M. A. Archives of Internal Medicine*, June, 1955.

CLINICAL NOTES

V, A "NEW" Rh ANTIGEN, COMMON IN NEGROES, RARE IN WHITE PEOPLE

Albert DeNatale, Ph.C.
Amos Cahan, M.D.
James A. Jack, M.S., New York
Robert R. Race, Ph.D.
and
Ruth Sanger, Ph.D., London, England

A "new" blood group antibody has been found in the serum of a white, adult patient (Mr. V), in St. Luke's Hospital, who suffered from an obscure anemia and received 26 transfusions between March 18 and Sept. 15, 1954. The antibody was first discovered at St. Luke's Hospital when the cross match for the 27th transfusion was incompatible; subsequent inquiry showed that this prospective donor was a Negro, as were six of the previous donors. The red blood cell antigen identified by this antibody at first appeared to be confined to Negroes but it has now disclosed itself as being present rarely in whites, frequently in New York Negroes, and still more frequently in West Africans. The antigen is associated with the Rh system, but until its precise place in that system becomes clear we propose to call it V.

ASSOCIATION OF V WITH Rh SYSTEM

The "new" antibody, anti-V, might not have been pursued had not the panel of test cells then in use at the Knickerbocker Foundation included several samples from Negroes. In these preliminary tests the only two positive reactions were among the six Negro samples in the panel of 20 selected bloods. Attention was thus focused on Negro blood, and samples from 168 New York Negroes were then tested with anti-V; they were also tested for the A_1 A_2 BO, MNSs (including Hu, He, and Vw), P, Rh, Lutheran, Kell, Lewis, Duffy, and Kidd groups. The two categories of people, those with V and those without it, had undisturbed distributions of all these groups save Rh. The distribution of V in the Rh types of the New York Negroes, and in some West African Negroes subsequently tested, is shown in table 1; the lack of V+ lower in the list can be crystallized in the following tabulation. This is out of propor-

From St. Luke's Hospital (Dr. DeNatale); the Knickerbocker Foundation (Dr. Cahan and Mr. Jack); and the Medical Research Council Blood Group Research Unit, the Lister Institute (Drs. Race and Sanger).

Dr. Luis A. Amill, Director of the Blood and Plasma Bank, St. Luke's Hospital, New York City, gave help and advice in this study.

Dr. D. A. Cannon, Medical Research Institute, Lagos, Nigeria; Dr. J. N. Marshall Chalmers, St. George's Hospital, London, England; Dr. G. M. Edington of the Medical Research Institute, Accra, British West Africa; and Mr. I. Sackey, Accra, supplied the samples from individuals and families in West Africa.

Dr. R. A. Zeitlin, South London Transfusion Centre, and the staff of the Lister Institute, London, England, supplied most of the samples from white persons.

Dr. T. J. Greenwalt, Milwaukee Blood Center, Milwaukee, supplied samples from the Milwaukee family.

Dr. C. A. Holman, Lewisham Group Laboratory, and Dr. K. E. Saunders, Dulwich Hospital, London, England, supplied samples from the Jamaican families.

tion to the extent that the "exact" probability is 1 in 9,860. A little of the sting is taken out of this probability because so many comparisons were made (for example, V+: V— with A: not A and V+: V— with M: not M); however, as will be seen from the family evidence, the association between V and Rh detected thereby was a true one.

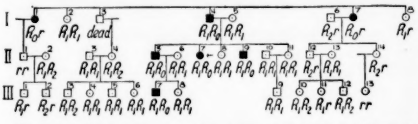
§ *cDE/cDe* cannot, without family evidence, be distinguished from *cDE/cde*.

FREQUENCIES

Table 2 shows the frequency of the antigen V, and that of its gene, in the three groups of people thus far tested. It can be estimated that in West African Negroes about 25% of *ce* chromosomes (*cDe* and *cde*) carry the gene *V*, and that in New York Negroes about 18% of these chromosomes carry it; owing to the smallness of the relevant samples it is not yet possible to give separate estimates for the two chromosomes. The West African sample, from Lagos, Nigeria, and Accra, British West Africa, is presumably heterogeneous; the people belonged to at least six different tribes. The Rh frequencies agree well with those of Chalmers, Ikin, and Mourant [1] for Nigeria. The New York Negroes were blood donors selected for darkness of skin. The Rh frequencies are very close to those found by Miller, Rosenfield, and Vogel [2] for the same population. The whites in London, England, were donors to the South London Transfusion Centre or were members of the Lister Institute. Both V+ donors and many of the relatives of one of them have been visited; there was no sign or history of any African ancestry. The blood of 444 white donors in New York has also been tested; two samples were V+, and both of them were found to be from Puerto Ricans. Three other Puerto Ricans included in this group were V–.

INHERITANCE

It proved too difficult to get samples of blood from the families of New York Negroes, so attention was turned to the possibility of getting family samples from West Africa. While the West African families (table 3) strongly suggested that the antigen V was inherited as a Mendelian dominant character, they were not capable of throwing light on the relationship of V to Rh because none of them segregated for both Rh and V. This stimulated us to continue the search for V in white people; in white families the segregation of the Rh genes is much clearer and V, if found, would inevitably be in the heterozygous state and so, with luck, should segregate too. The family of one of the two London V+ donors (table 2) provided exactly the information needed. The family heritage is shown in the figure, which gives proof that the antigen is a dominant character, for if it were recessive four unrelated members of this English family would



Heritage of English family, showing linkage between V and Rh. Solid designates family members with antigen V, dot designates those who lack the antigen V, and arrow designates propositus. R_0 = *cDe*, r = *cde*, R_1 = *CDe*, and R_2 = *cDE*. Rh antiserums used were: anti-C, -c, -C^{w}, -D, -E, -e, -f, and, sometimes, anti-C^{x} and anti-E^{w}.

have to be carriers of the gene responsible, i. e., I-5 and II-6 and the father and mother of generation I, which is not to be entertained.

The family also shows linkage between V and Rh; the *V* gene is carried on *cDe* chromosome. Propositus II-7 and appropriate members of her immediate family were at first labeled *CDe/cde* (cannot be distinguished serologically from *CDe/cDe*); however, the groups of I-1 and her son and the groups of I-7 and her daughter and granddaughter show that I-4 is evidently *CDe/cDe*. Since in this part of the argument we are assuming the linkage that we want to demonstrate, it should be pointed out that the family of I-4 shows the linkage of V with Rh irrespective of whether the chromosome with which it is linked is *cDe* or *cde*: this branch of the family scores 7:0 for linkage and to it can fairly be added I-2, making the score 8:0. (The ratio represents the number of people that show linkage to the number that would then have to be recombinants.) The probability that this apparent linkage is due merely to chance is but 1 in 128. The family was also tested for the other eight blood group systems and, some of the members, for the ability to taste phenylthiocarbamide. The segregations were such that close linkage could be excluded between V and sex, MNSs, P, and Kidd; the other groups did not give any linkage information.

FURTHER STUDIES

Serologic Details.—The blood groups of Mr. V. were B, *cde/cde*, Lu (a–), K–; his P, MNSs, Lewis, Duffy, and Kidd groups were in doubt due to the presence of

Dr. A. E. Mourant, Medical Research Council Blood Group Reference Laboratory, Lister Institute, London, England, supplied many of the antiserums.

1. Chalmers, J. N. M.; Ikin, E. W., and Mourant, A. E.: The ABO, MNS and Rh Blood Groups of the Nigerians, Ann. Eugenics **17**: 168, 1953.

2. Miller, E. B.; Rosenfield, R. E., and Vogel, P.: On the Incidence of Some of the New Blood Agglutinogens in Chinese and Negroes, Am. J. Phys. Anthropol. **9**: 115, 1951.

many transfused cells. The serum of the patient contained, beside anti-V, anti-Wr^a. Anti-V gives clear reactions by the indirect antiglobulin method; it also agglutinates V+ cells suspended in albumin. The agglutination of trypsinized V+ cells is powerful but somewhat obscured by weaker "false" agglutination of all trypsinized V– blood cells tested with this serum. It was obviously necessary to dissociate V from other antigens rare in white persons: V+ red blood cells failed to react with anti-C^x, -E^w, -Mi^a, -Be^a, -Vw, -Wr^a. Two examples of the rare Rh genotype *-D-/-D-* did not react with anti-V, nor did an example of the rare Rh genotype *cdeF/cdef*. It seems that the V antigens of white and Negro people must be the same: when anti-V was absorbed by V+ red blood cells from a white person it lost that V cannot be efficient at immunizing, but we must remember that the antibody would only be disclosed by a second transfusion of Negro V+ blood and furthermore, that it would be overlooked unless Negro blood were included in the subsequent investigation. The blood of the two English V+ donors was seen surviving in samples from their V– recipients two to three weeks after transfusion. One of these recipients has had a second transfusion of V+ blood without adverse reaction and without making detectable anti-V. The antigen V can hardly be an effective cause of hemolytic disease of the newborn infant; over 20% of Negro matings could provide candidates, yet the disease is relatively uncommon in these people and, when it does occur, is usually attributable to anti-D.

‡ *cDE/cDe* cannot, without family evidence, be distinguished from *cDE/cde*.

its reaction for V+ Negroes and vice versa. Saliva from a V+ person, as expected, did not inhibit the reaction of anti-V.

Development.—The antigen V is well developed at birth, judging by the cord blood sample in family 8 (table 3).

Sickling.—Blood samples of the West African Negroes were tested for sickling by Dr. Edington or by Dr. Marshall Chalmers. In the first 40 samples (in which there had been some selection for sickling) there was a highly significant association between the presence of sickling and the absence of V (p = about 1 in 1,000). This apparent association was entirely obliterated in the final counts. Perhaps the earlier sample was heterogeneous; heterogeneity was considered as a possible explanation of the association observed by Shapiro and Vandepitte [3] between Rh and sickling in the Congolese Bantu, a Negro tribe in the Belgian Congo.

TRANSFUSION AND PREGNANCY

Tens of thousands of white people must have received blood transfused from Negro donors, yet only Mr. V is known to have responded by making anti-V. It seems

DIFFICULTIES IN FINDING PRECISE PLACE OF V IN Rh SYSTEM

The significantly disturbed distribution of V within the Rh groups of unrelated people and the absolute linkage of V with Rh in the family shown in the figure clearly point to V being part of Rh. Assuming that V is part of Rh then its gene can be part of some *cde* chromosomes (because some *cde/cde* people have the antigen V); the gene *V* can also be part of some *cDe* chromosomes (see figure and table 3, family 9). The evidence is strong that *V* is not usually part of *CDe* or *cDE* chromosomes (because no *CDe/CDe, CDe/cDE, or cDE/cDE* people have yet been found to have V, and this absence is highly significant). If the chromosomes *cde* and *cDe* may carry the gene *V* and if the chromosomes *CDe* and *cDE* usually do not, then we would expect to find a higher frequency of the antigen V in *cde/cde, cDe/cde,* and *cDe/cDe* people than in *CDe/cde, CDe/cDe, cDE/cde,* and *cDE/cDe* people. This expectation was

3. Shapiro, M., and Vandepitte, J.: Blood Groups and the Sickle Cell Trait in the Congo Bantu, Résumés des Rapports et Communications, V^e Congrès International de Transfusion Sanguine, Paris, p. 73, 1954.

not realized in the New York Negroes, and the deviation is a significant one:

	V+	V−
Genotypes involving 2 *cde* or *cDe*	26 (29%)	65
Genotypes involving 1 *cde* or *cDe*	19 (31%)	43

but it was realized in the West Africans where the fit is good:

	V+	V−
Genotypes involving 2 *cde* or *cDe*	43 (46%)	51
Genotypes involving 1 *cde* or *cDe*	17 (35%)	32

The testing of more New York Negroes may solve this puzzle.

Is is unlikely that the gene *V* is allelomorphic to *D*. For example, I-1 in the figure is of the genotype *cDeV/cdev*, and her D antigen is apparently of the usual kind. (The anti-D in use was shown to be free from anti-V by its negative reaction with *cde/cde* V+ red blood cells.) The gene *V* is probably not allelomorphic to *C* or to *E*. Blood containing V can have apparently normal C and c antigens (as, for example, *CDe/cDe*); blood containing V can also have apparently normal E and e antigens (as, for example, *cDE/cDe*). The gene *V* could be an allelomorph of *f*. It is rather striking that the chromosomes that, in Negroes, may have *V* (*cde* and *cDe*) are those that, in whites, with but few exceptions, have *f* (Rosenfield and co-workers [4]).

The Negro samples in tables 1 and 3 were tested with anti-f and, as in whites, those bloods representing the chromosomes *cde*, *cDe* or *cD*^{u}*e* possessed the antigen f. Of the New York Negro samples 60 were tested against titrations of anti-f: there was a faint and far from significant hint that those containing the antigen V had a little less f antigen than had those lacking V. This slight hint made us wonder whether our anti-f serum is really anti-f plus anti-V. (Anti-f was one of several antibodies produced by a white patient in New York who had received about 35 transfusions of blood, some of which may have been donated by Negroes.) We have not, by appropriate absorptions, been able to demonstrate anti-V in the anti-f serum, but this does not convincingly exclude its presence there. Had we been able to exclude this possibility of *V* being an allelomorph of *f* we would have looked on it as a representative of a fifth Rh locus—*G*. When better understood, V cannot fail to throw further light on the structure of the Rh genes: already it is of potential clinical, anthropological, and evolutionary importance.

SUMMARY

A "new" blood group antigen has been found that, for the present, is being called V. It is common in Negroes and rare in white persons. Of 150 West Africans, 60 (40%) had V; of 168 New York Negroes, 45 (27%) had V; of 407 London whites, 2 (0.5%) had V; and of 444 New York whites 2 (0.5%) had V. The antigen is inherited as a dominant Mendelian character and belongs to the Rh system. The gene *V* can be part of some *cde* chromosomes and of some *cDe* chromosomes, but its precise place in the system is not yet clear.

CHEMICAL LABORATORY

The following report is the result of additional study on caffeine in instant and decaffeinated coffee.

WALTER WOLMAN, PH.D., *Director.*

INSTANT AND DECAFFEINATED COFFEE

In the report of the Chemical Laboratory in THE JOURNAL, July 23, 1955, page 1030, entitled "Xanthines, Tannins, and Sodium in Coffee, Tea and Cocoa" values for the caffeine content of the coffees examined were based on a gravimetric procedure. Subsequently, it was found that this method leads to erroneous values for caffeine in decaffeinated coffees. Nitrogen determinations by the Kjeldahl method on the residue obtained in the gravimetric procedure lead to results that more accurately represent the actual caffeine contents of coffees. The results reported in table 1 were obtained by the use of the Kjeldahl nitrogen method. The values expressed as maximum caffeine per cup, in milligrams, are calculated on the basis that 8.0 gm. of the ground bean coffee is equivalent to a rounded tablespoon and 2.5 gm. of the instant coffee is equivalent to a rounded teaspoon. Two hundred fifty milliliters of liquid is taken to represent a cup. If 1.3% is taken as an average for the caffeine content of regular roasted coffee beans, the results obtained indicate that the available decaffeinated ground bean coffees contain roughly one-fortieth of the amount of caffeine found in the regular coffee. The decaffeinated instant coffees also contain about one-fortieth of the amount of caffeine present in regular instant coffees. This is equivalent to 97% or more removal of caffeine from these coffees as has been indicated by various advertising claims. Table 2 gives the caffeine content of regular instant coffee determined by the Kjeldahl nitrogen method. The values expressed as maximum caffeine per cup, in milligrams, are again calculated on the basis of 2.5 gm. of the regular instant coffee per 250 ml. cup.

TABLE 1.—*Actual Amounts of Caffeine, by Kjeldahl Nitrogen Method*

	Average Caffeine, %	Maximum Caffeine per Cup, Mg.
Decaffeinated ground bean coffee		
Brand F	0.03	2.4
Brand G	0.05	4.0
Decaffeinated instant coffee		
Brand F	0.10	2.5
Brand H	0.08	2.0

TABLE 2.—*Caffeine Content of Regular Instant Coffee, by Kjeldahl Nitrogen Method*

Brand	Average Caffeine, %	Maximum Caffeine per Cup, Mg.
B	3.70	93
D	3.45	86
E	3.95	99

In the note appearing in THE JOURNAL, Aug. 13, 1955, page 1369, some question was raised about the reliability of the analytical procedure used originally. The data now presented indicate that inaccurate results were reported in the original article of July 23 in regard to the caffeine content of instant and decaffeinated coffees.

APPROVED INTERNSHIPS AND RESIDENCIES IN THE UNITED STATES

ANNUAL REPORT ON INTERNSHIPS AND RESIDENCIES BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS OF THE AMERICAN MEDICAL ASSOCIATION

Edward H. Leveroos, M.D., Arthur N. Springall, M.D. and Carl T. Heinze, M.S.H.A.

Annual Report

This 29th Annual Report of the Council on Medical Education and Hospitals presents information and statistical data on intern and resident training programs conducted in Council-approved hospitals located in the United States, Canal Zone, Hawaii, and Puerto Rico. The report is composed of descriptive material; statistical tables; information on the National Intern Matching Program, the Ad Hoc Committee on Internships, and the Internship Review Committee; and a brief report on foreign physicians serving as interns and residents in approved hospitals.

The material presented in the report was compiled from information submitted by hospitals approved for intern and resident training. The number of interns and residents serving and the number of vacancies in the intern and resident staff quoted in the statistical tables indicate the situation as of Sept. 1, 1954. Accordingly, there is a difference between the statistics presented in the tables and those in the lists of approved services, since the latter refer to appointments for the year beginning July 1, 1956.

Following the report, there are published lists of hospitals offering approved internships and residencies. The first list is devoted to hospitals approved for intern training, in which hospitals are listed by city and state; information is included on the type of control, the total number of beds, annual admissions, availability of outpatient services, the autopsy rate, the length of the program, affiliated services, the stipend, and the number and type of internships offered. A second classification lists these hospitals according to types of internships offered. The second section lists the approved residencies according to medical specialty, giving statistical data for the particular service, the name of the chief of service, and other pertinent information similar to that included in the internship list. In addition, hospitals approved for resident training are listed on a geographical basis, giving the specialties for which each hospital is approved.

The Annual Report and the lists referred to above, together with information on all approved examining boards in the medical specialties, are reprinted annually as the Directory of Approved Internships and Residencies.[1] The Council will furnish copies of this directory upon request. The publication of this report and the lists of approved hospitals is made possible through the cooperation of the medical staffs and the administrators of hospitals in which approved intern and resident programs are conducted. The Council gratefully acknowledges their support and assistance in providing the statistical data on which this report is based.

1. Information on the examining boards in medical specialties will be published in THE JOURNAL, Oct. 1, 1955.

The Council has collaborated with the following organizations in approving residency programs:

Advisory Board for Medical Specialties
American Academy of General Practice
American Board of Anesthesiology
American Board of Dermatology and Syphilology
American Board of Internal Medicine
  Subspecialty Board on Allergy
  Subspecialty Board on Cardio-Vascular Diseases
  Subspecialty Board on Gastroenterology
  Subspecialty Board on Pulmonary Diseases
American Board of Neurological Surgery
American Board of Obstetrics and Gynecology
American Board of Ophthalmology
American Board of Orthopedic Surgery
American Board of Otolaryngology
American Board of Pathology
American Board of Pediatrics
  Subspecialty Board on Allergy
American Board of Physical Medicine and Rehabilitation
American Board of Plastic Surgery
American Board of Preventive Medicine
American Board of Proctology
American Board of Psychiatry and Neurology
American Board of Radiology
American Board of Surgery
American Board of Urology
Board of Thoracic Surgery
American College of Physicians
American College of Surgeons

The Council expresses its appreciation to these organizations for their invaluable assistance, active participation, and continuing interest in the residency approval program.

The Annual Report is published for the information of the medical profession, medical educators, hospital administrators, and others interested in medical education at the internship and residency levels. It is hoped that the material contained in the report will be of value to young physicians and medical students in their efforts to further their training and in beginning their professional careers.

Internships

Table 1 presents a summary for the past 10 years of the number of hospitals approved for intern training and the number of approved internships. Last year, 844 hospitals offered 10,624 internships available as of July 1, 1955. This year there are 850 approved hospitals offering 11,048 internships, an increase of 6 approved hospitals and 424 internships. During the past 10 years, there has been an increase of 52 in the number of hospitals (7%), while the number of internships has increased from 8,584 to 11,048, or 29%. Ten years ago, the average number of interns per hospital was 10.8; in 1955, the average number is 12.9. It is significant to note that when the Council published its first list of approved hospitals in 1914, this list designated 603 hospitals that

offered 3,095 approved internships, an average of 5.1 interns per hospital. In comparing these data with the 1955 figures, there is an increase of 41% in the number of approved hospitals, while the number of internships has increased 257%.

The disparity between the number of approved internships and the number of American medical school graduates available each year to fill them is gradually increasing. There were 6,960 such graduates in 1955.

TABLE 1.—*Approved Hospitals and Internships, 1946-1955*

Year of Publication	No. of Hospitals	No. of Internships *
1946	798	8,584
1947	764	8,539
1948	807	9,118
1949	807	9,124
1950	799	9,398
1951	828	10,044
1952	865	11,467
1953	856	11,006
1954	844	10,624
1955	850	11,048

* U. S. Army and U. S. Navy hospitals and those outside the United States not included in 1946 and 1947 figures.

The disparity this year is therefore more than 4,000 internships, of which number less than one-half are filled by foreign medical school graduates. The Ad Hoc Committee on Internships in its final report to the House of Delegates recommended that hospitals offering intern training carefully reevaluate their individual needs for interns in an effort to reduce the number of vacant internships. It is of interest to note that 95% of currently approved hospitals will accept women medical graduates as interns and 19% of the approved hospitals offer dental internships; 79% are approved for residency training in one or more specialties. Hospitals offering approved internships located outside of continental United States include one in the Canal Zone, four in Hawaii, and five in Puerto Rico.

INTERNSHIPS, BY TYPE OF SERVICE

A breakdown of the number of approved internships by type of service is shown in table 2, including the number and percentage of those reported filled and vacant on Sept. 1, 1954. A total of 1,062 approved intern programs were offered in 850 hospitals. The total number of internships offered was 11,048. Of this number, 9,807, or 89%, were rotating in type. Straight internships, which included straight service assignments in the fields of internal medicine, pediatrics, surgery, obstetrics-gynecology, and pathology, showed the next largest number with 1,109 (10%) internships offered in this category. Mixed internships numbered 132, slightly more than 1%. In all instances, the percentage of internships offered in the three categories were the same as those for the previous year. The percentage of internships filled has increased slightly over last year's figures. Rotating internships were 82% filled on Sept. 1, 1954, as compared with a figure of 79% for the previous year. Mixed internships showed 82% against 68% for last year. Straight internships were 85% filled as compared with a previous percentage of 78.

Considering straight internships, there was an increase in those filled in internal medicine, pediatrics, and surgery. Internships in obstetrics-gynecology and pathology showed a low percentage of occupancy, probably due to the fact that the status of these straight services had not been clarified following the action of the House of Delegates in December, 1952, recommending elimination of these two categories. The Council has subsequently taken action regarding the straight internship in obstetrics-gynecology, all hospitals approved for this type of training having been notified that approval will be discontinued effective June 30, 1957. Final action concerning the straight internship in pathology is expected to be taken at the 1955 Interim Session of the American Medical Association in November.

The over-all figure for internships filled for 1954-1955 was 82%, an increase of 4% over 1953-1954. The number of vacant internships for all types dropped from 2,267 to 1,982, a decrease of 285. A further breakdown of these vacancies appears later in the report. The increased figure for internships filled is attributed to an increase of foreign medical school graduates serving as interns. The increase in American graduates, 99 more than in 1954, accounts for a part of the increase; however, there were approximately 2,000 more internships filled in 1954-1955 than there were American medical school graduates for that year.

INTERNSHIPS, BY TYPE OF HOSPITAL CONTROL

Table 3 shows the distribution of internships according to type of hospital control. Of the 11,048 approved internships, 629 (5.5%) were offered by federal hospitals; 3,404 (31%) by nonfederal governmental institutions; 6,954 (63%) were available in nongovernmental hospitals, and 61 (less than 1%) in proprietary hospitals. From the standpoint of positions filled on Sept. 1, 1954, three of the federal services group—the Public Health Service hospitals with an occupancy rate of 100%, Army hospitals with a rate of 99%, and Navy hospitals with 97% of their positions filled—and two of the nonfederal governmental group—county hospitals with 96% of their positions filled and city-county hospitals with an occupancy rate of 93%—were well above the average for all internships.

The governmental-controlled hospitals, both federal and nonfederal, showed an increase in the percentage of positions filled over last year; in 1954-1955 figures

increase in the number of interns on duty, 9,066 this year as compared to 8,275 last year. The average number of internships offered for federal hospitals was 15.7; the average number filled was 13.9. The figures for the nonfederal governmental hospitals were 26.6 and 23.6 respectively; for the nongovernmental group, 10.4 and 8.1; and for the proprietary hospitals, 6.1 and 4.1. The average number of internships available considering all hospitals was 12.9; the average number of internships filled was 10.6.

INTERNSHIPS, BY MEDICAL SCHOOL AFFILIATION AND BED CAPACITY

In this report and in the list of approved internships that follows, hospitals have been classified as "major teaching," "minor teaching," and "nonaffiliated," such classifications being based on the extent to which medical schools utilize these hospitals for undergraduate education. A "major teaching" hospital is one that is considered by the school as being a major unit in its undergraduate clinical clerkship program, while a "minor teaching" hospital is one utilized to a limited extent for undergraduate instruction. A "nonaffiliated" hospital is one not designated by a medical school as participating in such a program. Table 4 presents a statistical analysis of internships based on this classification.

The 140 hospitals designated as major units constituted 16% of approved hospitals for 1954-1955. They offered 4,017 internships, or 36%, of the total number. There were 73 minor teaching hospitals, or 9%, in which 849, or 8%, of internships were offered. By far the largest group of approved hospitals was that classified as nonaffiliated, of which there were 637, or 75%. This group offered 6,182 internships, or 56% of the total number.

The major teaching units had the highest internship occupancy rate—85%; the nonaffiliated group the lowest rate—80%. These rates were based on data as of Sept. 1, 1954. All three groups showed an appreciable increase in the percentage of internships filled over last year. The major units showed a 3% increase; the minor units had an occupancy rate of 81% as compared with 77% for the previous year; the nonaffiliated group showed a 4% increase. Occupancy rates varied from a low of 65% in hospitals with less than 200 beds to a high of 92% in hospitals with 500 or more beds; both these extremes occurred in minor teaching units.

The general trend indicates that the larger hospitals filled a higher percentage of their intern positions than did the small hospitals. This generalization is not directly applicable to the major teaching group, in which hospitals with less than 200 beds showed an occupancy rate of 87% while those classified as having 500 or more beds had a rate of 86%. The trend is borne out, however, if the data for hospitals of the same bed capacities are combined for major teaching, minor teaching, and nonaffiliated. The intern occupancy rates for this grouping are: hospitals of less than 200 beds, 77%; those having 200 to 299 beds, 76%; those with 300 to 499 beds, 83%; and those of 500 or more beds, 87%. Based on these statistics, it is evident that hospitals having a bed capacity of more than 300 filled an appreciably higher percentage of their internships than hospitals having less than this number.

Grand totals	850	9,066	1,982	82

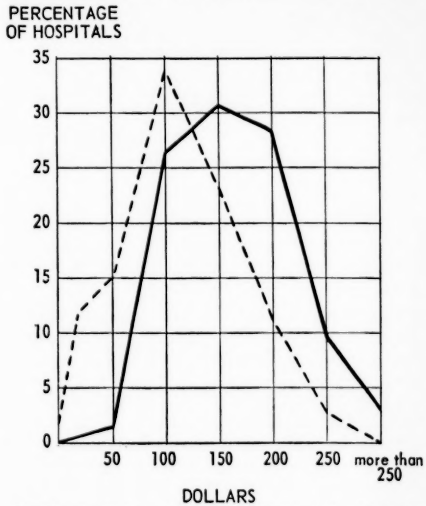
increase in the internship occupancy rate of 4% over last year; this increase is reflected in the rates for the census regions, each region in the continental United States having a higher rate than last year. Hospitals located outside the continental United States—those in the Canal Zone, Hawaii, and Puerto Rico—had 90% of their intern positions filled, the highest regional figure. The Pacific region had an occupancy rate of 88%, the highest in the United States. The region having the lowest percentage of intern positions filled was the East South Central region, with a rate of 72%. Occupancy rates varied in individual states from 100% in New Hampshire to 38% in Mississippi and Montana. These states, however, represent a small number of hospitals with one hospital approved in New Hampshire, while Montana and Mississippi each have two approved hospitals.

It is of interest to note that in the Middle Atlantic States—New York, New Jersey, and Pennsylvania—



Monthly stipends, by medical school affiliation, excluding federal hospitals. Solid line indicates nonaffiliated hospitals (609) and dashed line indicates affiliated hospitals (201). Abscissa gives upper level of stipend range.

there are located more than one-fourth of all approved hospitals, one-fourth of the approved internships, and one-fourth of all interns on duty in approved hospitals. These figures correspond roughly to the proportion of the total population of the United States living in these three states. Of these three states, Pennsylvania showed the smallest percentage of internships filled, 75%, which was considerably below the national average. There are no hospitals approved for intern training in Idaho, New Mexico, Nevada, and Wyoming.

INTERNSHIP STIPENDS

A survey of the allowances offered interns in approved hospitals is shown in table 6. In tabulating these statistics, the number of hospitals paying a monthly stipend in the designated category is indicated in the first column

under each listed stipend range. The number in the second, third, and fourth columns show the allowances given the intern in addition to the monetary stipend. Additional allowances offered refer to such items as laundry, uniforms, bonus, and health insurance.

All federal hospitals have been omitted from this listing. For purposes of comparison, hospitals have been classified as nonaffiliated and affiliated (major and minor teaching) groups. In the nonaffiliated group, which comprises three-fourths of the approved hospitals, the greatest concentration of cash stipends is centered in the classification $101-$150 (table 6). All hospitals in this group pay a cash stipend; only one pays $25 or less, and 17 pay more than $250. In addition to the stipend, 529 hospitals, or 87%, offer full maintenance; 61, or 10%, give partial maintenance; and 19 hospitals, or 3%, paid a cash stipend only. Other additional allowances are offered by 498 hospitals, or 82% of the group.

* Excludes federal hospitals.

In the affiliated group of 201 hospitals, the largest number pay stipends in the $51-$100 range. Four hospitals that have 300 or more beds give no monetary allowance. Only six hospitals in this group offer more than $200, and no hospital offers more than $250. A total of 161, or 80%, of these hospitals furnish full maintenance; 27, or 13%, furnish partial maintenance; and 13, or 7%, pay only a cash stipend. One hundred fifty-seven hospitals, representing 78% of this group, offer other prerequisites.

The average cash stipend offered interns by the nonaffiliated group for the year 1955 is $136 monthly; the amount paid by the affiliated hospitals is considerably less, the average being $87 per month. These averages are almost the same as last year's figures, which were $135 and $84 respectively. Although the average stipend in the nonaffiliated hospitals is $49 higher than that for the affiliated hospitals, the over-all internship occupancy rate for nonaffiliated hospitals for 1955 is 80%; that for the affiliated hospitals is 84%. It may, therefore, be concluded that the amount of the stipend is not the decisive factor for the graduating medical student in determining which internship he will select.

AUTOPSY RATES

A 25% autopsy rate on hospital deaths must be maintained by each hospital to qualify for approval for intern training. For the last reporting period (1954), all hospitals approved for internships submitted data from which their autopsy rates were computed. The average autopsy rate for these hospitals was 45%, or 20% more than the required minimum standard. The rate for federal hospitals was 61%; for other hospitals located in the United States, 44%, and for approved hospitals located outside the United States, 53%. Twenty-five hospitals (3%) had an autopsy rate of less than 25%. These hospitals must raise their autopsy rate for the next reporting period in order to qualify for continued approval. Table 7 includes a list of 20 federal and 20 nonfederal hospitals, approved for internships during the reporting period, that had the highest autopsy rates. The autopsy rate is considered an accurate index of the interest of the medical staff and the hospital administration in medical education and in scientific medical progress. Two-thirds of these listed hospitals were named in a similar table.[2]

AD HOC COMMITTEE ON INTERNSHIPS

The Ad Hoc Committee on Internships, a special committee composed of members of the House of Delegates of the American Medical Association, which was appointed in February, 1954, presented its final report last November.[3] This report was the result of an exhaustive

2. Approved Internships and Residencies in the U. S.: Annual Report of Internships and Residencies by the Council on Medical Education and Hospitals of the American Medical Association, J. A. M. A. 156: 315 (Sept. 25) 1954.

3. Report of the Ad Hoc Committee on Internships, Proceedings of the Miami Clinical Meeting, J. A. M. A. 157: 46-52 (Jan. 1) 1955.

study of the internship and its problems and included specific conclusions and recommendations. It was referred to the Council on Medical Education and Hospitals for its study and guidance. The Council presented a summary of the report to the House of Delegates, which was adopted in June, 1955.[4] The conclusions and recommendations of the Ad Hoc Committee on Internships, as presented by the Council and adopted by the House of Delegates, will be incorporated in a revision of the Essentials of an Approved Internship, to be published in January, 1956.

INTERNSHIP REVIEW COMMITTEE

The Internship Review Committee was established early in 1954. It is a permanent committee that acts in an advisory capacity to the Council. It recommends approval or disapproval of new and currently approved intern training programs, after a thorough analysis of the data submitted by the hospital and review of the report of the field representative of the Council that is submitted on completion of his survey of the program. In setting up the committee the Council has sought the cooperation of other national organizations concerned with intern education. In addition to members of the Council, the committee includes representation from the American Hospital Association, the Association of American Medical Colleges, the Federation of State Medical Boards in the United States, and the American Academy of General Practice. This committee continuously studies the problems and the content of the internship and makes recommendations to the Council that will assure the maintenance of high educational standards in approved hospitals and a year of sound clinical education and experience for the intern.

NATIONAL INTERN MATCHING PROGRAM

The National Intern Matching Program has completed four years of successful operation as the agent for appointing medical school graduates to internships in hospitals approved for such training by the Council on Medical Education and Hospitals. As a result of a detailed study of the policies and methods of the Matching Program, the Ad Hoc Committee on Internships concluded: "It is the opinion of this committee that the mechanical plan of matching interns and hospitals, as accomplished by the National Intern Matching Program, is more efficient than any other plan previously used and gives full effect to the freely expressed desires of both hospital and intern with complete objectivity. The committee approves of the Matching Plan."

The Ad Hoc Committee pointed out that there was some criticism of the program due, in all probability, to a misunderstanding of the method of operation. Acting on this information, the Matching Program began an intensive effort to provide detailed information regarding its activities to all concerned, including medical schools, approved hospitals, graduating medical students, and the medical profession as a whole. Explanatory material was distributed to interested individuals and organizations, outlining the policies and methods of operation of the Matching Program.

Other organizations interested in the internship along with the Council on Medical Education and Hospitals of the American Medical Association determine the policies under which the program operates. These are the American Hospital Association, the American Protestant Hospital Association, the Catholic Hospital Association, and the Association of American Medical Colleges. Also on the policy-making committee are two medical student representatives; one is appointed by the Student American Medical Association, the other is a student delegate at large. Each of the federal services conducting intern training programs has a liaison representative to the committee.

The National Intern Matching Program offers a method of intern placement consistent with American principles of individual freedom. Its basic principle of operation is to preserve freedom of choice for both the student and the hospital. The program does not approve, restrict, or control the internships offered by hospitals; it does not allocate or distribute interns. Its sole purpose is to facilitate the orderly placement of senior medical students in first year internships.

Hospitals participating in the program are limited to those approved by the Council on Medical Education and Hospitals for intern training. In the internship and residency section of THE JOURNAL, as prepared and pub-

4. Report of the Council on Medical Education and Hospitals, Organization Section, J. A. M. A. 158: 53-54 (May 7) 1955.

lished by the Council, hospitals offering approved internships that do not participate in the Matching Program are appropriately designated. The directory of participating hospitals, as distributed to all senior medical students by the Matching Program, is based on the Internship and Residency Number of THE JOURNAL; hospitals not participating in the program are not included in the reprint that is sent to the applicants for internships and to medical schools. The Matching Program sends to each senior medical student a pamphlet explaining in detail its purpose and its method of operation. Due to the efforts made to clarify the operations of the program, there is a better understanding of its work than previously existed. The program has been established as the official and generally accepted method of appointing interns.

For the year 1955-1956, more than 98% of the hospitals approved by the Council for intern training participated in the Matching Program. Approximately 96% of graduating medical students in 1955 registered in the program. Of the 6,713 students seeking appointments, 6,379, or 95%, were successfully matched. Of this number, 76% were matched with hospitals they had listed as their first choice; 14% were matched with hospitals they had listed as their second choice; and 10% were matched with hospitals they had listed as third choice or lower. A total of 334 students were not matched. The number of unmatched participants is attributed to the fact that in general they had applied to a limited number of hospitals. This resulted in restricting their chances for appointment, since the hospitals listed had filled their quotas with applicants whom they preferred or did not wish to appoint the particular student as intern.

Of the hospitals participating in the Matching Program, 16% completely filled their intern quotas; 52% partially filled their quotas, while 32% had no interns matched. Student participation in the Matching Program is expected to increase slightly for the year 1956-1957. The return of Matching Program Agreements, which have been distributed to approved hospitals for 1956-1957, indicate that at least an equal number of hospitals will participate in the program, as did last year.[5]

INTERNS AND RESIDENTS FROM FOREIGN COUNTRIES

According to a survey made by the Institute of International Education in September, 1954, there were 5,036 graduates of foreign medical schools in 83 countries serving as interns or residents in United States hospitals approved by the Council for this training.[6] This figure applied to citizens of other countries who intend to return to their home countries when their training assignments in the United States are completed; it did not include displaced persons, physicians coming to the United States to establish residence, or persons from United States possessions and territories; nor did it include foreign physicians serving in hospitals not approved by the Council. The 12 countries having the largest representation were: Philippines 776, Canada 520, Mexico 425, Germany 323, Turkey 253, Italy 242, Cuba 184, China 170, India 165, Korea 151, Greece 155, and Japan 139.

McCormack and Feraru [6] reported that of the total number of foreign physicians taking graduate training in this country, 3,275, or 65%, were serving as residents; 1,761 were interns. In tabulating statistics on the residents taking specialty training, it was found that the two largest groups were in general surgery and general medicine. Other fields in which training was being given were, in order, obstetrics and gynecology, pediatrics, pathology, psychiatry, anesthesiology, radiology, and otolaryngology.

These foreign physicians were found to be training in 42 states, the District of Columbia, Puerto Rico, Hawaii, and the Canal Zone. A total of 1,186, 24%, were concentrated in the state of New York. Other states having sizable numbers of these physicians were Ohio, 424; Massachusetts, 405; Illinois, 396; New Jersey, 348; Pennsylvania, 262; Missouri, 216; Michigan, 184; Maryland, 172; and California, 160.

The present policy of the Council is that graduates of foreign medical schools may be appointed to the intern or resident staff of a hospital without prejudice to its approved status. Responsibility for the evaluation of the applicant's qualifications must be assumed by the hospital, however, in those cases in which the applicant is a graduate of a school other than those included in the list prepared by the Council in collaboration with the Association of American Medical Colleges.[7]

The Cooperating Committee on Evaluation of Graduates of Foreign Medical Schools is presently studying the entire problem of foreign medical school graduates, with particular reference to graduate training for these physicians. The Committee is composed of representatives of the following interested organizations: the Council on Medical Education and Hospitals of the American Medical Association, the American Hospital Association, the Association of American Medical Colleges, and the Federation of State Medical Boards in the United States.

Residencies

The further expansion of residency training in the United States is reflected in the three tables included in this section of the Annual Report. The Council currently approves residency programs in 29 specialties and subspecialties. These programs are conducted in 1,181 general or special hospitals, the majority of which are also approved for intern training.

Early in 1953, the Council entered into discussions with the American boards in the medical specialties for the purpose of establishing joint committees with representatives from both organizations, the function of these committees being primarily that of responsibility for the evaluation and approval of residency programs in the specialty concerned. The forerunner for these committees was the Residency Review Committee for

5. For further information on the program, address request to Director of Operations, National Intern Matching Program, Room 2009, 185 N. Wabash Ave., Chicago 1.

7. Medical Licensure Statistics for 1954, 53rd Annual Presentation of Licensure Statistics by the Council on Medical Education and Hospitals of the American Medical Association, J. A. M. A. **158**: 292 (May 28) 1955.

Internal Medicine, which was originally established prior to World War II with representatives from the Council, the American Board of Internal Medicine, and the American College of Physicians. In 1950 a similar committee, the Conference Committee on Graduate Training in Surgery, was established. As in internal medicine, this committee included representatives from the college, as well as from the board, i. e., American College of Surgeons and American Board of Surgery. Residency Review Committees are now functioning in 16 separate fields including dermatology, internal medicine, neurological surgery, ophthalmology, orthopedic surgery, otolaryngology, pediatrics, physical medicine, plastic surgery, preventive medicine, proctology, psychiatry, radiology, surgery, and urology. A Residency Review Committee for General Practice with representatives from the American Academy of General Practice and the Council has been established during the past year. In four specialties, anesthesiology, obstetrics-gynecology, pathology, and thoracic surgery, the Council approves programs in concurrence with the board concerned, each organization however, taking action unilaterally.

* Surgery A includes programs leading to certification by the American Board of Surgery.

† Surgery B includes programs approved as offering training in general surgery in preparation for a residency in a surgical specialty.

The following section of the Report presents statistical data on the number of residencies by specialties and the number of residencies by type of hospital control and by bed capacities of the hospitals in which the training is conducted. The number of residencies filled and vacant represent the situation as of Sept. 1, 1954. The total number of residency appointments available increased from 23,628 reported last year to 25,486 this year, an increase of 8%. The number of residents serving also rose, from 18,617 during the year 1953-1954 to 20,494 during 1954-1955, representing a 10% increase. It can be assumed on the basis of available data, that the largest proportion of this increase was due to the number of graduates of foreign medical schools serving as residents in approved hospitals. The percentage of residencies filled remained comparatively the same with 80% filled this year, compared with 79% a year ago.

NUMBER OF RESIDENCIES, BY SPECIALTIES

Table 8 presents a breakdown by specialties of the number of approved programs, the number of first year appointments filled and vacant as of Sept. 1, 1954 and the total number of appointments filled and vacant for the same date. There were 4,834 separate residency programs conducted last year in 1,181 hospitals, offering a total of 25,486 appointments including 10,989 at the first year level.

The number of hospitals approved for training ranged from 11 offering residencies in contagious diseases to 578 in internal medicine. The clinical specialties of internal medicine, obstetrics-gynecology, pediatrics, psychiatry, and surgery, along with pathology and radiology, accounted for slightly more than three-fourths of all residencies offered, with 19,359 positions available in these specialties out of a total of 25,486. There were less than 100 appointments in each of the following specialties: allergy, 34; cardiovascular diseases, 68; contagious diseases, 29; gastroenterology, 63; malignant diseases, 34; plastic surgery, 72; preventive medicine, 71; and proctology, 31.

The percentage range of first year residencies filled varied from 32% of those in preventive medicine to 94% of the programs offering a straight service in gynecology. Similarly, for appointments at all levels, the percentage filled in preventive medicine was the lowest, 37%, while those in straight gynecology had the highest occupancy rate, 98%.

Of those specialties constituting the majority of residencies offered, pathology residencies showed the lowest occupancy rate for all years, 64% (first through fourth year appointments) while surgery showed the highest, 91%. Specialties in which more than 25% of residencies were vacant included the following: allergy, general practice, malignant diseases, neurology, otolaryngology, pathology, physical medicine, preventive medicine, proctology, psychiatry, and pulmonary diseases. In considering the relatively high vacancy rate in some of these specialties, particularly pathology and psychiatry, the proportionately large number of positions available

should be taken into account; 1,130 residents serving last year in approved pathology programs and 1,800 in psychiatric residencies.

As was the case last year, the percentage of all internships filled and that of all residencies were approximately the same, 82% in the case of internships and 80% for residencies. This fact again points up the similarity of the problem of house staffing, whether at the internship or residency level. In considering possible solutions, the singling out of internship vacancies as a nature. The total number of residency appointments was about equally divided between governmental and nongovernmental hospitals with those in the former category offering 12,564 residencies while those in the latter had 12,922 appointments available.

Of the federal group, the Veterans Administration accounted for over three-fourths of the total, with 3,120 residency positions offered out of 4,089 for all federal hospitals. The occupancy rate for all federal hospitals, including the Veterans Administration was about 8%

TABLE 9.—*Number of Residencies, by Type of Hospital Control, 1954-1955*

separate problem may well be considered unrealistic, representing as it does only a part of the over-all question of house staffing.

RESIDENCIES, BY TYPE OF HOSPITAL CONTROL

A breakdown of residency appointments by type of hospital control is presented in table 9. Residency programs were offered in 117 federal hospitals, 314 other governmental (nonfederal) hospitals, 721 nongovernmental institutions, and 29 hospitals of a proprietary

below that for the nation as a whole, 72% as contrasted to 80%. Comparable figures for last year showed 75% of residencies in federal hospitals filled and 79% for all hospitals. Considering appointments in all categories, the occupancy rate varied from 51% in U. S. Naval hospitals to 89% in city-controlled institutions. If first year appointments only are considered, the disparity in occupancy rates between federal and all other hospitals is even more marked. The U. S. Naval hospitals reported 38% of their first year appointments filled, the U. S.

Air Force 55%, the Veterans Administration 61%, the U. S. Army 64%, and other federal institutions 82%. The rates for other governmental (nonfederal) hospitals were well above these figures, ranging up to 89%, as were those in the nongovernmental group in which the rates ranged from 71% for church operated to 82% for the not-for-profit group.

In spite of the fact that the occupancy rate in federal hospitals fell below that of other approved hospitals, the number of residents serving in these programs increased over last year; there were 2,909 residents on duty in these hospitals as of Sept. 1, 1954 compared with 2,711 a year before. The seeming disparity between an increase in the number of residents serving and a decrease in occupancy rate in federal hospitals is due of course to the fact that 428 more residencies were available in these hospitals this year. This represents an approximate 12% increase for this group, as compared to a 7% increase over last year for all other hospitals.

NUMBER OF RESIDENCIES, BY HOSPITAL BED CAPACITIES

Excluding hospitals of less than 100 beds, the number of hospitals offering residency training are, roughly speaking, about equally divided into four categories, 100 to 199 bed capacity, 200 to 299, 300 to 499, and over 500 beds (table 10). The number of residencies offered in these hospitals however, varied considerably, with those in the 100 to 199 bed category offering 1,678 positions, or approximately 7% of the total and those of 500 beds and over, having 13,062 positions available or 52% of the total. Hospitals of bed capacities 200 to 299 and 300 to 499 offered an additional 10,297 residencies, or 40%. Hospitals of less than 100 beds and programs in institutions of undesignated bed capacities accounted for the remaining 1%.

A word of explanation may be in order regarding those hospitals of less than 100 beds, since they would appear to be of too small size to support a residency program. For the most part, they are hospitals of special type providing services in one or two specialties only such as children's orthopedic surgery; eye, ear, nose, and throat; obstetrics; pediatrics; and similar specialized fields. In these hospitals, the admission rate approximates that for a service in a larger general hospital. They offered a relatively insignificant number of residencies.

While the average number of residencies per hospital in the several categories listed may not be too important, it is of some significance in considering the distribution of residents. The averages are as follows: 100 to 199 beds, 7.4 residents per hospital; 200 to 299 beds, 11.6 residents; 300 to 499, 24 residents; and 500 and over, 44.8 residents per hospital. Since the total number of beds for all hospitals in each category has not been computed, the average number per resident cannot be accurately given. Using the mean number of beds for each category however, it can be estimated that the number of beds per resident vary from 12.5 in the 300 to 499 group, to 21.5 in the 200 to 299 category. A further variable in considering these rough estimates is of course the specialty itself; the number of beds that would be adequate for an obstetric service, for example, would be insufficient to support a program in orthopedic surgery.

On the basis of these incomplete data, however, it does not appear that there is a marked disproportion between the number of residencies and the size of the hospital. This generalization does not of course eliminate the possibility that there may be an "overloading" of residents in some hospitals. It does tend to show, however, that there is, on the average, a reasonable number of beds per resident in the majority of hospitals approved for residency training.

Résumé

An analysis of 10 statistical tables relating to internship and residency positions has been presented in this report, along with a brief review of the National Intern Matching Program and of the activities of the committees established to evaluate graduate training programs at the internship and residency levels.

As of Sept. 1, 1954, there were 1,364 hospitals sponsoring such programs; 159 were approved for intern training only, 515 for residency training only, and 690 that offered approved training in both categories. The number of internships rose from 10,624 offered a year ago to 11,048 this year, an increase of 4%. Similarly, the number of residencies increased during the past year from 24,741 to 25,486 or 3%.

A total of 29,560 physicians were on duty in approved hospitals during the past year, 9,066 in the capacity of interns and 20,494 as residents. The occupancy rate for internships in 1954 was 82% as compared to 78% a year before. That for residencies was 80%, approximately the same as reported in last year's report when 79% of appointments were filled.

The report points out that internship vacancies and residency vacancies are part of the same general problem. It calls attention also to the fact that an increasing number of graduates of foreign medical schools are serving in house staff positions in hospitals throughout the country. This development has been well recognized although the extent to which these graduates have been appointed has been, perhaps, less generally appreciated. Reference is made in the report to a committee, the Cooperating Committee on Evaluation of Graduates of Foreign Medical Schools, which has been established to study the problems presented in evaluating these graduates as potential interns and residents in hospitals in this country. Information on interns' stipends and hospital autopsy rates is presented along with analysis of internship appointments. Similarly, the section on residencies presents data on those programs, which from the standpoint of number involved, represent 70% of all house staff appointments, internships accounting for the remaining 30%. The report is factual in nature and is presented for the information of the profession and others interested in the graduate phase of medical education.

APPROVED INTERNSHIPS

Council on Medical Education and Hospitals of the American Medical Association
535 North Dearborn Street, Chicago 10

Revised to September 1, 1955

HOSPITALS, 865, INTERNSHIPS, 11,645

The following general hospitals, investigated and approved by the Council on Medical Education and Hospitals, are considered in position to furnish acceptable intern training in accordance with standards adopted by the American Medical Association. Three types of internships are approved by the Council—rotating, mixed, and straight:

1. A rotating internship is defined as one which provides supervised experience in internal medicine, surgery, pediatrics, obstetrics, and their related subspecialties, together with experience in laboratory and radiologic diagnosis.

2. A mixed internship is defined as one that provides supervised experience in two or more, but not in all, of the clinical divisions named.

3. A straight internship is defined as one that provides supervised experience in a single department, although it may include limited opportunity for work in a related subspecialty. Straight internships are now approved in internal medicine, surgery, and pediatrics. Straight internships in obstetrics-gynecology and in pathology are presently approved through June 30, 1957.

Hospitals approved for internships that are used by medical schools for undergraduate clinical clerkships on inpatient services have been identified in the following lists by the symbols **X** and **x.** Hospitals have been identified with symbol **X** when a medical school has indicated that the hospital is a major unit in the school's teaching program. Hospitals have been identified with the symbol **x** when a medical school has indicated that the hospital is used to a limited extent in the school's teaching program. Certain internships in hospitals designated as teaching hospitals may not provide for assignments to teaching services. Other internships may provide for only a portion of the internship period being spent on teaching services. Prospective interns desiring specific information concerning internship assignments to teaching services in a hospital are advised to communicate with the dean of the medical school with which the hospital is affiliated. Medical school affiliations are indicated by footnotes 10 to 88 placed immediately after the symbol **X** or **x**. The list of medical schools appears on page 283. The plus (+) sign indicates additional approval for residencies in specialties, as shown in the Council's list of Approved Residencies and Fellowships. The beginning stipends for Federal hospitals have not been listed; they are established in accordance with government pay tables. When applying for internships in Air Force, Army, Navy or Public Health Service hospitals, applications should be directed to the medical departments of the Air Force, Army, Navy, or the United States Public Health Service and not to the individual hospitals. Although applications are made to the service rather than to the individual hospitals, all of the services ask students to list three hospitals in order of preference. Every possible effort is made to place successful candidates in accordance with their desires. Because of the needs of the service it should be understood that students may, in some instances, be assigned to other hospitals than those for which they have indicated a preference.

Hospitals listed below (pages 261 to 282) make first year internship appointments through the National Intern Matching Program, Inc. The number and type of internships as listed represent appointments for the intern year 1956-1957.

Hospitals designated with an asterisk (*) in this listing do not participate in the National Intern Matching Program, sponsored by the American Medical Association, the American Hospital Association, the Association of American Medical Colleges, and other cooperating organizations.
Abbreviations and other references will be found on pages 283 and 284.

HOSPITALS APPROVED FOR INTERNSHIPS IN THE DOMINION OF CANADA

The following list of hospitals that conform to the standards of the Canadian Medical Association is published for the information of graduates interested in an internship appointment in a Canadian hospital. Hospitals that are unqualifiedly approved as conforming to the standards of the Canadian Medical Association may be considered as offering internships equivalent in educational value to those in hospitals approved for intern training by the Council.

This list, revised to Sept. 1, 1955, was furnished by the Canadian Medical Association.

Name of Hospital	Location
St. John's General Hospital	St. John's, Nfld.
Camp Hill Hospital	Halifax, N. S.
Halifax Infirmary	Halifax, N. S.
Victoria General Hospital	Halifax, N. S.
Moncton Hospital	Moncton, N. B.
Saint John General Hospital	Saint John, N. B.
Hotel-Dieu St.-Vallier	Chicoutimi, Que.
Children's Memorial Hospital	Montreal, Que.
Herbert Reddy Memorial Hosp.	Montreal, Que.
Hospital Sainte-Jeanne-d'Arc	Montreal, Que.
Hospital Sainte-Justine	Montreal, Que.
Hospital Saint-Luc	Montreal, Que.
Hotel Dieu de Montreal	Montreal, Que.
Jewish General Hospital	Montreal, Que.
Montreal General Hospital	Montreal, Que.
Notre-Dame Hospital	Montreal, Que.
Queen Elizabeth Hospital	Montreal, Que.
Queen Mary Veteran's Hospital	Montreal, Que.
Royal Victoria Hospital	Montreal, Que.
St. Mary's Hospital	Montreal, Que.
Hospital de l'Enfant Jesus	Quebec, Que.
Jeffery Hale's Hospital	Quebec, Que.
L'Hotel-Dieu, Quebec	Quebec, Que.
Saint-Sacrement Hospital	Quebec, Que.
Veteran's Hospital	Quebec, Que.
Ste. Anne's Hospital	Ste. Anne de Bellevue, Que.
Sherbrooke Hospital	Sherbrooke, Que.
Hospital General de Verdun	Verdun, Que.
Brantford General Hospital	Brantford, Ont.
McKellar General Hospital	Fort William, Ont.
Hamilton General Hospital	Hamilton, Ont.
St. Joseph's Hospital	Hamilton, Ont.
Hotel Dieu Hospital	Kingston, Ont.
Kingston General Hospital	Kingston, Ont.
Kitchener-Waterloo Hospital	Kitchener, Ont.
St. Joseph's Hospital	London, Ont.
Victoria Hospital	London, Ont.
Westminster Hospital	London, Ont.
Oshawa General Hospital	Oshawa, Ont.
Ottawa Civic Hospital	Ottawa, Ont.
Ottawa General Hospital	Ottawa, Ont.
Peterborough Civic Hosp.	Peterborough, Ont.
General Hosp. of Port Arthur	Port Arthur, Ont.
St. Catharines Gen. Hosp.	St. Catharines, Ont.
Hospital for Sick Children	Toronto, Ont.
Mount Sinai Hospital	Toronto, Ont.
St. Joseph's Hospital	Toronto, Ont.
St. Michael's Hospital	Toronto, Ont.
Sunnybrook Veterans' Hospital	Toronto, Ont.
Toronto East General Hospital	Toronto, Ont.
Toronto General Hospital	Toronto, Ont.
Toronto Western Hospital	Toronto, Ont.
Women's College Hospital	Toronto, Ont.
Grace Hospital	Windsor, Ont.
Hotel Dieu of St. Joseph	Windsor, Ont.
Metropolitan Hospital	Windsor, Ont.
St. Boniface General Hosp.	St. Boniface, Man.
Children's Hospital	Winnipeg, Man.
Deer Lodge Hospital	Winnipeg, Man.
Misericordia Hospital	Winnipeg, Man.
Winnipeg General Hospital	Winnipeg, Man.
Regina General Hospital	Regina, Sask.
Regina Grey Nuns' Hospital	Regina, Sask.
St. Paul's Hospital	Saskatoon, Sask.
Saskatoon City Hospital	Saskatoon, Sask.
Calgary General Hospital	Calgary, Alta.
Colonel Belcher Hospital	Calgary, Alta.
Holy Cross Hospital	Calgary, Alta.
Edmonton General Hospital	Edmonton, Alta.
Misericordia Hospital	Edmonton, Alta.
Royal Alexandra Hospital	Edmonton, Alta.
University of Alberta Hospital	Edmonton, Alta.
Royal Columbian Hosp.	New Westminster, B. C.
St. Paul's Hospital	Vancouver, B. C.
Shaughnessy Hospital	Vancouver, B. C.
Vancouver General Hospital	Vancouver, B. C.
Royal Jubilee Hospital	Victoria, B. C.
St. Joseph's Hospital	Victoria, B. C.
Veterans' Hospital	Victoria, B. C.

ABBREVIATIONS AND NOTES

1. Appointments available to women applicants
2. Appointments restricted to women applicants
3. Appointments available to graduates of foreign medical schools. Details regarding requirements for appointment can be secured from the hospitals concerned.
4. Dental internships available
5. Available to citizens of the United States only
6. General Practice internships

+ The plus sign indicates additional approval for residencies in specialties, as shown in the Council's list of Approved Residencies and Fellowships.

ChurchRel	Church Related
ChurchOpr	Church Operated
CyCo	City and County
Corp	Corporation unrestricted as to profit
NPCorp	Nonprofit corporation
Part	Partnership
Req	Required
FM	Full maintenance
PM	Partial maintenance

Medical School Affiliations

Footnotes 10 to 88 refer to medical schools affiliated with hospitals for undergraduate clinical clerkships.

Hospitals have been identified with symbol **X** when a medical school has indicated that the hospital is a major unit in the school's teaching program. Hospitals have been identified with symbol **x** when a medical school has indicated that the hospital is used to a limited extent in the school's teaching program.

APPROVED RESIDENCIES AND FELLOWSHIPS

Council on Medical Education and Hospitals of the American Medical Association

535 North Dearborn Street, Chicago 10

Revised to September 1, 1955

Hospitals, 1,201; Assistant Residencies, Residencies and Fellowships, 25,841

The following services are approved by the Council on Medical Education and Hospitals as meeting the requirements of the Essentials of Approved Residencies and Fellowships. In those specialties in which certifying boards have been established approval is extended in concurrence with the Board concerned as indicated. The number of years of training for which approval has been granted is indicated in the column, "Length of Approved Program (years)." Residencies in which this designation does not appear have been approved without specifying the number of years for which they are accredited. The beginning stipends for Federal hospitals have not been listed; they are established in accordance with government pay tables. For information on affiliate services, refer to pages 356 to 363.

INDEX TO LIST

1. Allergy 291

15. ORTHOPEDIC SURGERY

Type of training acceptable to Board: A—Adult orthopedics; C—Children's orthopedics; F—Fractures. The following services have been approved by the Council and the American Board of Orthopedic Surgery, through the Residency Review Committee for Orthopedic Surgery, as offering acceptable training in adult orthopedics, children's orthopedics, and fractures. Training in the basic sciences is given either as an integral part of these services or as a separate course. Services collaborating in an integral plan of training are designated by a program number, a list of which is found on pages 318-319.

Residents completing their training in these hospitals are eligible for full certification by the American Board of Orthopedic Surgery, including children's orthopedic surgery.

Hospitals, 198; Assistant Residencies and Residencies, 807

The following services have been approved by the Council and the American Board of Orthopedic Surgery, through the Residency Review Committee for Orthopedic Surgery, as offering acceptable training in adult orthopedics and fractures. Training in the basic sciences is given as an integral part of these services or as a separate course. Services collaborating in an integral plan of training are designated by a program number, a list of which is found on pages 318-319.

Residents completing their training in these hospitals are eligible for limited certification by the American Board of Orthopedic Surgery, not to include children's orthopedic surgery.

15. ORTHOPEDIC SURGERY—Continued

The following services are approved by the Council and the American Board of Orthopedic Surgery, through the Residency Review Committee for Orthopedic Surgery, as offering acceptable training in one or more but not all categories of orthopedic surgery. Hospitals included in this list are urged to develop a full three year program, either independently or in collaboration with other institutions in order to assure applicants for appointment of an opportunity for completing their training with progressive graded responsibility.

17. PATHOLOGY

The following services have been approved by the Council and the American Board of Pathology. Services which have been evaluated on the basis of training in the two categories, pathologic anatomy and clinical pathology, are designated as follows: a—pathologic anatomy only; c—clinical pathology only; p—pathologic anatomy and clinical pathology. Training in hospitals which are not so designated in this list will be evaluated by the Board on an individual basis at the time of application for certification.

Hospitals, 489; Assistant Residencies and Residencies, 1,855

Name of Hospital	Location	Chief of Service	Number of Autopsies	Number of Surgical Specimens	Number Examined Microscopically	Total Number of Laboratory Examinations	First Year Residencies Offered [8]	Total Residencies Offered [8]	Length of Approved Program (Years)	Beginning Stipend (Month)

State of Washington	Seattle	B. Bucove	King-Seattle	771,100*	$500
			Clark-Skamania	90,400*	.....

* Estimated.

(a) Excludes Alameda, Berkeley, and Oakland cities with full-time health officers, and Albany and Livermore with part-time officer.

(b) Excludes the city of Wilmington.

(c) To those planning to work in state; transportation costs only to others.

(d) Excludes Berwyn, Chicago, Evanston, Oak Park, Stickney Township, and Winnetka (including Glencoe, Kenilworth, Northbrook, and remainder of New Trier Township), all with full-time health officers.

(e) Assistance can be arranged for securing the MPH degree in the midst of, or after completion of, residency experience. Appointments normally are limited to those training for service in Illinois.

(f) Arrangements for remuneration made on an individual basis.

(g) Arrangements for remuneration made upon determination of field of interest and location desired.

(h) Training is given in a combination of one county, one union health, and seven municipal health departments and in the divisions of the State Department of Health.

(i) To those training for service in Massachusetts only.

(j) Excludes Detroit and Dearborn, each with full-time health officers.

(k) To those training for service in Minnesota only.

(l) Training is given in any one of 10 city health departments, 16 county health departments, or 15 district offices within the state.

(m) Training to be with Michigan Department of Health, with field experience in local health departments.

Numerical and other references will be found on page 363.

PSYCHIATRY PROGRAM IDENTIFICATION

10. Service in child psychiatry.
11. Six months service at Los Angeles County Hospital, Los Angeles.
12. Nine months service at Mount Zion Hospital, six months at Langley Porter Clinic and service in child psychiatry, San Francisco.
13. Three months of service at Napa State Hospital, San Francisco Hospital, Strickton State Hospital, Sonoma State Home and San Quentin Prison; and six months at Colwell Memorial Hospital.
14. Three months service Fort Miley Veterans Administration Hospital, San Francisco, and Langley Porter Clinic, San Francisco; may include elective services at University of California Hospital, Mount Zion Hospital and Stanford University (Lane) Hospital, San Francisco.
15. Three months service at Pacific Colony Hospital, Spadra, and three months service in child psychiatry at Camarillo State Hospital.
16. Affiliate services at Colorado General and Denver General Hospitals.
17. Affiliate service at Veterans Administration Hospital, West Haven Connecticut State Hospital, Fairfield State Hospital, Norwich State Hospital and service in child psychiatry.
18. Twelve months service at Grace-New Haven Community Hospital, New Haven, Connecticut.
19. Six months service at Governor Bacon Health Center, Delaware City.
20. Two months service at George Washington University Hospital, Washington, D. C.
21. Affiliate service at University Hospital, Augusta, Georgia.
22. Twelve months service at the Neuropsychiatric Institute of the University of Illinois including service in child psychiatry.
23. Eighteen months affiliate service including service at the Neuropsychiatric Institute of the University of Illinois and three months in child psychiatry.
24. Affiliate service at Neuropsychiatric Institute of the University of Illinois and service in child psychiatry.
25. Three months service at Veterans Administration Hospital, Downey, Illinois, and service in child psychiatry.
26. Six months service at Veterans Administration Hospital, Hines, Illinois. May include service in child psychiatry.
27. Six months service in child psychiatry.
28. Integrated program including service at Veterans Administration Hospital, Indianapolis General Hospital and Indiana University Medical Center and Affiliated Hospitals, Indianapolis.
29. Integrated program including service at Veterans Administration Hospital, Menninger Sanitarium and Topeka State Hospital, Topeka, Kansas.
30. Four months service at University of Louisville Services, Louisville, Kentucky, and four months service at Cincinnati General Hospital, Cincinnati, Ohio.
31. Three months service at University of Louisville Services, Louisville, Kentucky.
32. Twelve months service at University of Louisville Services. May include four months service at Central State Hospital; four months service at Louisville General Hospital.
33. Four months service at Central State Hospital and service in child psychiatry.
34. Integrated program including service at Tulane University Unit, Charity Hospital, New Orleans, and Veterans Administration Hospitals, New Orleans, and Gulfport, Mississippi.
35. Six months service in child psychiatry and twelve months service at South Louisiana State Hospital.
36. Service in child psychiatry; six months service at Veterans Administration Hospital, Perry Point, Maryland.
37. Three months service in child psychiatry at Johns Hopkins Hospital (Harriet Lane House), Baltimore, Maryland.
38. Twelve months service at Boston State Hospital and service in child psychiatry.
39. Twelve-eighteen months service at Veterans Administration Hospital, Boston (Jamaica Plain), Massachusetts, and six months service in child psychiatry.
40. Integrated program including service at Massachusetts General Hospital and McLean Hospital, Waverly.
41. Twelve months service at University Hospital, Ann Arbor, Michigan.
42. University Hospital, Ann Arbor, Michigan.
43. Three months service Coldwater State Home and Training School, Caro State and Ionia State Hospitals and service in child psychiatry.
44. Six months service in child psychiatry at Children's Hospital, Detroit.
45. Six months service at Receiving Hospital, Children's Hospital, Detroit, and Wayne County General Hospital and Infirmary, Eloise, Michigan.
46. University of Minnesota Hospitals, Minneapolis, Minnesota.
47. Three months service at Rochester State Hospital, Rochester, Minn.
48. Affiliate service at Barnes Hospital, St. Louis and three months at St. Louis State Hospital.
49. Six months service at Barnes Hospital, St. Louis, Missouri.
50. Service at St. Louis State Hospital and St. Louis City Hospital.
51. Service at Lutheran Hospital, Omaha.
52. Service at University of Nebraska Hospital.
53. Affiliate service at University of Nebraska Hospital and Creighton Memorial-St. Joseph Hospital, Omaha, Nebraska.
54. Six months service at Newark City Hospital; three months at New Jersey State Hospital and three months in child psychiatry.
55. Three months service at Albany Hospital, Albany, New York.
56. Affiliate services at Edward J. Meyer Memorial Hospital and Buffalo State Hospital.
57. Six months service at King's County Hospital, Brooklyn, New York.
58. Integrated program with service at Bellevue Hospital Center and University Hospital.
59. Six months service at Mount Sinai Hospital, New York City.
60. Service in child psychiatry. May include six months service at Mount Sinai Hospital and three months at Manhattan State Hospital.
61. Twelve months service at New York Hospital and four months at Veterans Administration Hospital, New York City (Bronx), New York.
62. Three months service at Grasslands, Rockland State, Albany Hospitals and Letchworth Village.
63. Six months service at Rochester State Hospital, Rochester, New York.
64. Six months service at Strong Memorial-Rochester Municipal Hospitals, Rochester.
65. Affiliate service at Strong Memorial-Rochester Municipal Hospitals.
66. Three months service at Syracuse Memorial, Binghamton, Syracuse and Willard State Hospitals, service at Craig Colony and service in child psychiatry.
67. Affiliate service at State Hospitals at Raleigh and Butner, North Carolina.
68. Eighteen months service at Duke Hospital, Durham, North Carolina.
69. Three months service at Longview State and Jewish Hospitals, Cincinnati.
70. Integrated program including service at Cleveland Clinic and Windsor Hospital.
71. Integrated program including service at University Hospital and Veterans Administration Hospital, Cleveland, Ohio.
72. Integrated program with service at Institute of the Pennsylvania Hospital and Pennsylvania Hospital Department for Mental and Nervous Diseases.
73. Affiliate services at Temple University Hospital, Institute of Pennsylvania, Hospital of the Woman's Medical College of Pennsylvania.

ANNUAL REPORT ON INTERNSHIPS AND RESIDENCIES

The Council on Medical Education and Hospitals presents in this issue its 29th Annual Report on Internships and Residencies. The report is factual in nature and presents statistical data on the number of internships and residencies in hospitals throughout the country, as well as general information on committees active in the field of graduate education, on the National Intern Matching Program, and on other related subjects. The report is based on data supplied by 1,364 hospitals in the United States and its possessions in which approved training at the graduate level is being conducted. Some of the statistics presented are of particular interest, reflecting the extent to which graduate education has developed in this country. One such statistic is the total number of physicians serving as house staff members; there were, according to the report, 9,066 graduates serving internships as of September 1, 1954, and 20,494 serving as residents, or a total of 29,560. When one considers that this figure exceeds the number of students enrolled last year in all our medical schools, one can appreciate more clearly the magnitude of the growth of graduate training over the past 10 years. In terms of persons involved and of time spent, the graduate phase of medical education has now come to occupy a place comparable to that at the undergraduate level.

The percentages of positions filled last year increased for both internships and residencies. While the increase was small, 4% for internships and 1% for residencies, it did reverse the downward trend of the past several years. The report points out that the increase was due, in large part, to the greater number of graduates of foreign medical schools serving in approved hospitals. While their presence alleviates to some extent the demand for house staff appointees, it is apparent that in partially solving one problem on this basis, others have been created. The report notes that a Cooperating Committee on Evaluation of Graduates of Foreign Medical Schools has been established to consider these problems as they affect standards of medical education. The Council and the agencies with which it cooperates, as well as the medical staffs and administrative heads of the hospitals contributing to this annual report, are to be commended for making available to the profession and others interested in medical education, this comprehensive compilation of information on a phase of medical education that continues to grow in importance.

"FULL TRAINING" REQUIREMENT FOR RESIDENCY APPROVAL

In this issue (page 382) there are several announcements made regarding future policy relative to approval of residency training in four specialties. In all of these announcements, the same principle is applicable; i. e., hospitals, to qualify for continued approval, are required to provide "full training" in the specialty, either independently or in collaboration with other hospitals through integration of their programs. In considering this development, the history of the residency approval program, particularly during the past 10 years, is pertinent. Prior to 1945, there were about 5,000 residency positions available in approved hospitals throughout the country. This figure included appointments at all levels —first, second, and third year positions. In the immediate postwar period there was a tremendous demand for residency training, particularly from medical officers being released from military service. Hospitals that had been conducting residency training expanded their programs to take in additional residents, and many hospitals that had not previously attempted to train residents were encouraged to initiate such programs. As a result, the number of residencies increased at an unprecedented rate until now there are roughly five times as many residency positions available as there were 10 years ago.

In retrospect, the soundness of the overexpansion of training facilities can be questioned. At the time, however, the policy of encouraging the development of new programs and the enlargement of those already in existence was justifiable. Had this marked inflation of the residency system not taken place, a large number of applicants would have been denied additional training and would, perforce, have had to return to practice without the opportunity to enhance their professional knowledge and background in the field of their choice. There are those who take the position that many of the hospitals that entered the field of residency training during those years were not in a position to provide the type of training considered optimal. With this generality, one cannot perhaps quarrel. One may raise the question, however, as to whether the public interest was not better served under a program in which the maximum number of physicians received additional training in preparation for civilian practice than under a more restrictive policy through which a relatively limited number of physicians would have had the opportunity for a more intensive and perhaps higher quality of residency training.

In any event, a number of residencies were approved during the past 10 years for periods of training varying

from one to four years. Under policies that have been applicable in the past, a resident could take his training in two or three such separate programs and qualify for board examination in the specialty. A not too inaccurate analogy would be one in which a medical student would be able to qualify for his doctorate degree through having completed four successive years at the freshman level in four different medical schools. To obviate this possibility, and to assure that residents finish their training with some degree of continuity of supervision and of increasing, graded responsibility, a number of the committees responsible for evaluating and approving residency programs have adopted the policy that hospitals offering residencies in these specialties should provide full training for their residents either by developing independently a complete training program or by integrating their residency with one or more other hospitals that by combining their resources can provide full training in the specialty. The validity of this policy from an educational standpoint is difficult to refute. It will, of course, result in some hospitals having to discontinue their programs unless they can meet the requirement for complete training. In the interest of improving the standards of graduate medical education, however, and of the residents themselves, the policy as adopted by the residency review committee is eminently sound.

"ANNUAL" APPROVAL FOR RESIDENCY TRAINING

The number of hospitals approved for residency training has remained relatively constant for the past few years. There have been of course, some changes in the status of these institutions as new programs are approved and others are dropped from the list of recognized services. In the latter instance, there is quite apt to be a fairly strong reaction on the part of the medical staff and administration of the hospital concerned. One of the reasons for the protests that occasionally result when approval is terminated is the misconception that once approval is granted it is more or less permanent. In effect, approval of a residency program is granted on an annual basis through inclusion in the list of services that appears in the Internship and Residency issue of THE JOURNAL. Approval of a program is continued automatically until there is a change in the service such as the appointment of a new department head or until such time as the program is resurveyed. These surveys are made every two to three years and the findings referred to the appropriate reviewing committee. Their evaluation of the program is based on the report of inspection as developed by the staff representative of the Council and on the data submitted by the hospital. Continued approval is considered warranted only when it is evident that standards for training are being met. Approval is not continued, however, simply on the basis that the residency had been approved in the past.

A residency program should be constantly reappraised by the medical staff itself, if only to assure that the program's objectives are being met. Unless such periodic self-evaluations are made, it is quite likely that the program will deteriorate and on survey will be found to have deficiencies that may be considered serious enough to result in withdrawal of recognition. A fairly reliable, if somewhat homely guide in evaluating the adequacy of a program, is whether it is a service that one could recommend unqualifiedly to someone seeking one's best advice. If so, there need be little concern over continued approval of the program. If not, there is need for corrective action that might well be taken as a preventive measure prior to, rather than after, the evaluation of the approving committee. As in medicine, the ounce of prevention may well be worth the pound of cure.

BOSTON CLINICAL MEETING

The Clinical Meeting of the American Medical Association to be held in Boston, November 29 to December 2, 1955, marks the ninth assembly of this winter feature. Since its inauguration in Cleveland in January, 1948, the clinical meeting has developed a distinctive pattern and has become an outstanding contribution to graduate medical education. Predictions for the Boston meeting indicate one of the largest clinical meetings on record. The program will soon be ready for publication. Lectures and round-table discussions, arranged by the local committee in Boston and covering all phases of medicine, will be conducted in three lecture halls simultaneously and continuously, thus giving the visiting physician a varied group of subjects from which to choose. Color television, originating at New England Deaconess Hospital, will bring the operating room into the lecture hall. The local committee is arranging an outstanding program of both medical and surgical subjects. A carefully selected list of motion pictures, in some cases supplementing other features of the program, will be shown continuously, with many of the authors present to discuss their films. The Scientific Exhibit will be as attractive as ever, with outstanding authorities continuously available to answer questions and discuss problems with other physicians. Special mention should be made of the fracture exhibit and the manikin demonstrations on problems of delivery where experts will be available for consultation. The Technical Exposition, where all leading medical supply houses will be represented, will show visitors what is new in equipment, books, and pharmaceuticals. All scientific activities will be held in the Mechanics Building. This historic structure will fit the purposes of the meeting comfortably. The House of Delegates will be meeting meanwhile in the Statler Hotel. Boston is always interesting to visit, having many historic and modern attractions. Lexington and Concord are nearby. The program of this meeting, built against an absorbing background of medical history, will make the 1955 clinical meeting doubly worth while.

THE PRESIDENT'S PAGE

A MONTHLY MESSAGE

I am often told that the younger practitioners are more or less responsible for much of the dissatisfaction that exists in the minds of the public concerning medical fees. I also have heard many people say that the older physicians are more understanding when it comes to charges for medical services but that many of the younger men aspire too rapidly for financial success and security for themselves and their families. However, I am satisfied that the over-all attitude of the younger men is substantially good and that most of them only wish to be received and treated fairly in the communities where they have elected to settle and practice. It must be remembered that the average young physician has little chance to earn a living until his late 20's and early 30's. Let us for a moment look at his education and its cost. The average boy graduates from high school at about 18 years of age. The cost of four years of college and medical school is about $6,000 just for his education. This does not include his room and board nor his loss of earnings during this period of eight years. This alone would amount to approximately $24,000 for the period. The total cost then for an M.D. is approximately $38,000. Then at least one year's internship is necessary. Here for the first time he may receive a small remuneration. According to conservative estimates then the current cost of becoming a physician starting practice at age 30 is at least $52,000, and the physician will need $7,000 of gross fees every year for 35 years to amortize his investment. During the process of their academic education many of these young men acquire wives and one or more children, all of which add to their need for making a living as well as practicing a legitimate profession.

It is a difficult thing for me, after traveling the length and breadth of this grand country of ours, meeting actually thousands of these younger practitioners, to believe that their sole interest is money and that they have little or no regard for the financial and economic problems of their patients. However, there is another problem concerning these younger men that does disturb me a great deal. Let us now carry one of these younger men through a residency training program where he is fitting himself for a speciality. Here the problem becomes greatly complicated and much more difficult. After an internship the youthful physician, the wife and children in many instances, accepts a three or five year approved residency in one of the specialities. He may receive a small salary, but it is seldom sufficient. Certainly he does not in any sense earn enough to cover his expenses. Some speciality boards make him practice his speciality for a minimum of two years after completion of his residency. Attached to this obligation to make him eligible for his examinations is the penalty of forfeiting his right to take his boards if he practices anything but the specific speciality for which he has trained. In other words, he cannot, if preparing for his surgical boards, treat medical cases. If the young surgeon can associate himself with an older, well-established surgeon, his road to the examinations is relatively easy, but, if he elects solo practice, his road is hard and thorny unless he is personally well off financially. He finds that while he is excellently trained, patients of other established physicians are not going to rush to him for surgery. They look upon him as inexperienced, and he has a difficult time in getting established.

Since economic factors are very important, and the small family is hungry and no work shows up, he finds himself beset with many problems. The most important is—"Can I remain ethical and stick it out?" Of course I say he can, but some men so harassed are sorely tempted. The problem is simply an economic one. Fee splitting and other obnoxious procedures may become a great temptation. Strong must be the character of the specialist if he is to resist temptation. I am convinced that the majority of these men are of strong character. It takes at least two to make a bargain. There are many economic urges that could make the deal seem justifiable, but once the deal is made the die is cast for the future. I sometimes think that our specialty boards are too severe when they do not permit the young specialist to treat any patients except those that fall into his special field during these first trying years of practice. It is my opinion that a specialist is first a physician, and I am sure that, with the present demand for good physicians, these young specialists will be able to brave the economic storm and come up unscathed. Doctors have faced difficulties before and overcome them. They can do it again.

Youthful physician, youthful specialist, the future of medicine is in your hands. We believe in you.

ELMER HESS, M.D.,
Erie, Pa.

ORGANIZATION SECTION

FEDERAL MEDICAL LEGISLATION

First Session, 84th Congress

Disability Insurance for Employees in District of Columbia

Senators Case (R., N. J.), and Ives (R., N. Y.) have introduced S. 2753, the administration's proposal to establish a mandatory system of cash payments for temporary disability of workers in the District of Columbia. Disability is defined as "the inability of an individual as a result of his physical or mental illness, disease, or injury to perform his most recent, customary, or reasonably similar work," and would not be necessarily due to his employment. The benefits would be half of the individual's average wage, with a maximum of $36 and a minimum of $12, and could not be collected for more than 26 weeks within a 52 week period. The benefits would be financed by a payroll tax. The employee's contribution could not exceed 0.5% of his earning, or 30 cents per week, whichever is the lesser. Employers could use an insurance program or contract with an employee union or corporation for coverage. If the payroll is less than $20,000 annually the employers could use a special District of Columbia insurance fund for coverage. This bill was referred to the Committee on the District of Columbia.

Dependent Medical Care for the Military

Congressman Price (D., Ill.) by request has introduced a measure designed to set up a voluntary health insurance program for military dependents, with nonprofit plans (Blue Cross) to be used in every case where such service is available. The federal government would bear the full cost of the premium, and no charge could be made for costs in military facilities except for subsistence. This measure was referred to the Committee on Armed Services.

Hospital Reading Matter

Congresswoman Green (D., Ore.) proposes, in H. R. 7841, to authorize the Post Office Department to give "unclaimed or undeliverable books, newspapers, magazines, and other publications" to hospitals, asylums, or reformatory institutions. Delivery would be effected without cost to the United States. This bill was referred to Committee on Post Office and Civil Service.

Surplus Property for Hospitals, Clinics, and Health Centers

Congressman Ellsworth (R., Ore.), in H. R. 7425, would authorize donations from the general services of surplus property found usable and necessary for educational or Public Health purposes, including research, to nonprofit and tax-supported medical institutions, hospitals, clinics, health centers, and colleges. This measure was referred to the Committee on Government Operations.

Services to Aging

Senator Wiley (R., Wis.), in S. 2279, would authorize grants to states for planning and programs for services to the aging. This measure would authorize 2 million dollars for planning grants and 10 million dollars the next year for programs and such sums thereafter for three years as Congress desires. The program would be under the supervision of the Secretary of Health, Education, and Welfare, and would be administered in each state by a single agency. This bill was referred to the Committee on Finance.

Federal Scholarship Act

Congressman Multer (D., N. Y.), in H. R. 7846, would authorize loans to enable needy and scholastically qualified students to continue education after high school, including premedical. A federal trust fund would be established with 4 million dollars the first year and 10 million dollars the second. The program would be administered by the Commissioner of Education, who would select the students certified to him by the state agency. The state contribution would vary from 5% to 10% of the amount of the scholarships. This measure was referred to the Committee on Education and Labor.

Prepared by the Washington Office of the American Medical Association.

NEW TELEVISION AIDS

Two new television "scripts-with-film" programs featuring health education information on the eye and its functions will be released this fall by the A. M. A. Prepared with the cooperation of the A. M. A.'s Bureau of Health Education and the National Society for the Prevention of Blindness, these shows are designed so that a local physician can narrate while the film is thrown on the television screen. The programs are: (1) "A Clear Picture"—which deals with the eye and its functions and includes an animated sequence employing a fresh orange, a glass lens, and a piece of lipstick to show the structure of the eye; and (2) "Wonderful Spectacle"—which describes the functions of glasses and lenses. The programs are so constructed that they can be used as separate 15 minute programs or together as a single 30 minute presentation. The film demonstrator is Dr. Brittain F. Payne of New York City, an ophthalmologist. Films and accompanying scripts will be available about Sept. 15 through the A. M. A. TV Film Library. There is no charge to medical societies.

QUARTERLY CUMULATIVE INDEX MEDICUS

Volume 53 (Jan.-June 1953) of the Quarterly Cumulative Index Medicus is now available. Orders for copies should be addressed to the Order Department, 535 N. Dearborn St., Chicago 10, Ill.

COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

POLICY RELATING TO APPROVAL OF RESIDENCY PROGRAMS

The Council on Medical Education and Hospitals wishes to make the following policy announcements relating to approval of residency programs. The statement on basic sciences in an approved surgical residency has been adopted by the Conference Committee on Graduate Training in Surgery, representing the Council, the American Board of Surgery and the American College of Surgeons. Statements regarding the discontinuance of approval for "partial" training in a number of the specialties have been adopted by the Residency Review committees for the specialties concerned. These committees represent the Council and the respective examining boards in approving residency programs. A similar announcement relating to residency programs in pediatrics appeared in the April 10, 1954, issue of THE JOURNAL (page 1303). Approval for residency training in anesthesiology, general surgery, otolaryngology, and plastic surgery, as well as in medical subspecialties, allergy, cardiovascular diseases, gastroenterology, and pulmonary diseases, has for some time been limited to hospitals offering full training, either independently or in collaboration with other hospitals.

STATEMENT ON BASIC SCIENCES IN AN APPROVED SURGICAL RESIDENCY

A fundamental concept of an approved residency in general surgery requires that the program provide for properly organized, integrated and progressively graded clinical training in the specialty. The Conference Committee on Graduate Training in Surgery interprets this concept as requiring a continuity of clinical experience under the supervision of the surgical staff of the hospital or hospitals in which such training is conducted. Accordingly, the Conference Committee while recognizing the value of formal courses in the basic sciences, will not accept these courses as part of a three or four year program, in lieu of clinical experience. When provision is made for the resident to attend such courses, they will be accepted by the American Board of Surgery as credit toward the practice requirement, in addition to an approved three year residency. An approved four year residency may include a research project or an assignment to a basic science department such as pathology, provided that this part of the program has been approved by the Conference Committee. The final year of a four year program, however, must be spent in clinical surgery in the parent institution. The above provisions will be considered effective on and after July 1, 1956, for all residencies in general surgery approved by the Conference Committee, representing the American Board of Surgery, the American College of Surgeons, and the Council on Medical Education and Hospitals of the American Medical Association.

RESIDENCY REVIEW COMMITTEE FOR ORTHOPEDIC SURGERY

At a recent meeting of the Residency Review Committee for Orthopedic Surgery, representing the American Board of Orthopedic Surgery and the Council on Medical Education and Hospitals, the Committee reviewed its policy relative to the approval of training programs of less than three years' duration, i. e., programs offering training in one or more but not all aspects of the specialty. It was the considered opinion of the Committee that hospitals should provide for an opportunity for full training, either intramurally or through affiliation in order to assure fully integrated educational experience with continuity of supervision of the resident staff. Accordingly, the Committee will have serious reservations about continuing approval of those programs offering "partial" training beyond June 30, 1956, unless the hospitals concerned can develop a complete residency training program to include adult orthopedic surgery, fractures, basic sciences, and, if possible, children's orthopedic surgery. This action is in accordance with the policy that has been announced for the past several years, encouraging the development of full three year programs in the listing of approved services in the Internship and Residency issue of THE JOURNAL, Sept. 25, 1954, page 375.

RESIDENCY REVIEW COMMITTEE FOR RADIOLOGY

At a recent meeting of the Residency Review Committee for Radiology, representing the American Board of Radiology and the Council on Medical Education and Hospitals, the following policy was adopted. 1. Effective immediately, hospitals and institutions making initial application for approval for residency training in radiology must qualify for full three year approval. No new residencies of one or two year duration will be approved unless they are integrated with or contributory to a fully approved program. 2. All hospitals and institutions approved for residency training in radiology are expected to develop programs offering complete training, either intramurally or through affiliation, by June 30, 1957. The Residency Review Committee representing the American Board of Radiology and the Council on Medical Education and Hospitals has been established to act in behalf of these two organizations in approving residency programs in this specialty. The present policy relating to future approval for full training only has been adopted to insure that residents receive integrated training with graded responsibility and continuity of supervision during their three year residency. The requirement of a fully organized program in qualifying for approval is in accord with sound educational principles as adopted in several other specialty fields. The Committee does not believe it to be in the interest of the resident that he be permitted to take a year or more of isolated training in two or three unrelated programs

V 1
195

in qualifying for board examination. The Committee has had the assurance of the board that residents who have accepted appointment to programs that are presently approved for less than three years will receive full credit for their training on the basis of the residency's present status, through June 30, 1957.

RESIDENCY REVIEW COMMITTEE FOR UROLOGY

At a recent meeting of the Residency Review Committee for Urology, the following policy was adopted. 1. Effective Oct. 1, 1955, hospitals making initial application for residency training in urology must qualify for three year approval (i. e., no new approvals for either one or two years will be granted). 2. Those hospitals now approved for residency training that are resurveyed after the above date must qualify for three year approval or lose their approved status. 3. All hospitals must have qualified for three year approval by July 1, 1957. Up to this date hospitals offering two year programs will have the opportunity to reorganize their programs and qualify for three year approval. Hospitals offering or that are able to offer only one year of training will have the opportunity to become affiliated with another institution that has a fully approved three year program. This committee with representatives from the American Board of Urology and the Council on Medical Education and Hospitals of the American Medical Association has been established to review and pass upon applications for approval of residency training in urology, acting in behalf of the two parent organizations. In adopting the present policy, the committee has had the assurance of the American Board of Urology that residents currently serving and residents appointed to begin their service on or before July 1, 1955, in such hospitals approved for one or two years will receive credit for such training even if the approval status of the program may be terminated at a time prior to completion of the academic year in which they are serving. The American Board of Urology will also continue to grant credit for training in hospitals presently approved at the one or two year level whose programs are not reevaluated on the basis of surveys during the residency year 1955-1956. This policy was adopted to insure that residents receive integrated training during their three year service, with graded responsibility and continuity of supervision. The requirement of a fully organized three year program is in accordance with the principle that has been adopted in other specialties of granting approval only on the basis of a fully organized program.

MEDICINE AND THE LAW

MEDICOLEGAL SYMPOSIUMS

Early in April the physicians and attorneys in Cortland County, New York, met together and heard a discussion by Albert Averbach, of the Seneca Falls, N. Y., Bar, on mutual problems, responsibilities, and attitudes. This experience, which was described in a recent letter from Mr. Averbach, is a relatively new and increasingly popular form of meeting that the Law Department feels is worthy of comment.

Last December Mr. George Hall, a staff member of the department, prepared an article for the *Illinois Bar Journal* with the optimistic title, "Let's Understand Each Other." In reference to meetings such as Mr. Averbach describes, the article states ". . . These meetings bring together the local lawyers and doctors for an evening of sociability and a discussion of some of their mutual problems. It would be a fine thing if such meetings could be held at least once a year in every county in the state. The result of these meetings is an understanding of each other's problems. Perhaps it would not furnish a witness for a particular case, but it will help each profession to respect the aims and attitudes of the other. . . . To the extent, also, that the attorney, by education, becomes aware of the physician's fears and problems, he will be able to approach the physician more tactfully and with better chance of success. If this article does nothing else, it is hoped that it may inspire the holding of medical society-bar association meetings at local level throughout the state. The results are sure to be gratifying to both professions and beneficial to patients and clients alike."

At about the same time another article appeared in the *New York State Journal of Medicine* under the title of "Doctors, Lawyers, and Injured Brains" in which Dr. Sands of Brooklyn, N. Y., said: "There should be mutual respect of physicians and lawyers for the responsibilities and attitudes of each other. This would prove a positive contributing factor to judicial verdicts. . . . Appreciation and respect of each others attitudes and responsibilities would contribute a better relationship between doctors and lawyers."

The American Medical Association has long been cognizant of the desirability of improving better professional relationships between physicians and attorneys. As early as 1944, its then Bureau of Legal Medicine and Legislation said in an annual report to the House of Delegates: "Periodic programs of this type, attended by members of the bar and by physicians, will result in a much needed diffusion of information in this important field." And in its final report last year, the Bureau said: "There seems to be evidenced a trend toward more frequent meetings of this sort. This is a healthy development that should be nurtured by medical and legal organizations." The trend referred to is not only apparent, it is real. The urgings of the American Medical Association, its Committee on Medicolegal Problems, and of others in this field are continually bearing more abundant fruit.

Since the creation of the Law Department last August, activity along this line has been intensified and staff members have participated in joint meetings at other places and most recently at Great Falls, Mont.; Appleton, Wis.; Dubuque, Iowa; Carbondale, Ill.; Oklahoma City; Minneapolis; Madison, Wis.; Springfield, Ill.; Toledo, Ohio; and Knoxville, Tenn.

What may well prove to be the A. M. A.'s most important contribution to date in the field of legal medicine is a series of Medicolegal Institutes that the Law Department and the Committee on Medicolegal Problems will sponsor next fall. Like the custom of prior years, the Committee on Legislation is planning six regional legislative meetings. Three of these meetings will be held on Saturdays in Chicago on Oct. 8, in Omaha on Oct. 15, and in New York City on Oct. 29. On the three Sundays that follow, Oct. 9, Oct. 16, and Oct. 30, the Law Department will sponsor all-day sessions, discussing various medicolegal problems of interest to, and open to, the physicians and attorneys in the particular area. Definite programs have not as yet been worked out, but the Law Department sincerely hopes and believes that these programs will be both interesting and informative.

The experience of the physicians and attorneys in Cortland County, New York, is being duplicated in many parts of the country. The snowball is growing larger. Physicians and attorneys will understand each other, they will improve their professional interrelationships, and society and the administration of justice will benefit from their efforts in this regard.

MEDICAL NEWS

CALIFORNIA

Course in Pathological Physiology.—University of California Extension in Los Angeles will open a course in pathological physiology to graduates of approved medical schools, Mondays, 7:30-9:30 p. m., Oct. 3-Dec. 19, in the third floor lecture room (33-103) of the University of California Medical Center, Los Angeles. The course is designed to aid practicing physicians in applying to clinical problems certain concepts relatively recently developed by the physiological sciences concerning the pathogenesis of disease. The effects of therapeutic procedures, particularly as they cast light on the physiological processes under discussion, will also be considered. Registration is limited. Requests for registration should be addressed to Dr. Thomas H. Sternberg, Assistant Dean for Postgraduate Medical Education, University of California Medical Center, Los Angeles 24.

ILLINOIS

Personal.—Dr. Milton A. Dushkin, assistant medical director, North Shore Health Resort, Winnetka, has been appointed psychiatric consultant on the staff of the Illinois State Office of Civil Defense.

Dr. Peterson Night.—Dr. Martin D. Peterson, Paxton, was honored recently when more than 125 persons attended a banquet in appreciation of his service to Paxton, where he has practiced for 38 years, and to Rankin, which he has served for 9 years. The Paxton Chamber of Commerce presented him with a plaque in commemoration of the event. Dr. Peterson has served as county physician for the past 15 years and city physician for the past 20 years.

Chicago

Volunteer Medical Company.—A meeting of the Volunteer Medical Company 9-20, U. S. Naval Reserve, will be held at the U. S. Veterans Research Hospital, Room A-302, 333 E. Huron St. (MOhawk 4-6600), at 8:15 p. m. Sept. 27. "Urological Complication of Gynecologic Surgery" will be presented by Dr. Alfred W. Kneucker, associate in surgery, Chicago Medical School.

Courses in Radiological Physics.—Courses in two new specialized fields created by the atomic age, health physics and radiological physics, will be offered by the University of Chicago School of Medicine, beginning Oct. 4. Both two year programs lead to the master's degree. The research institutes of the university have a battery of radiation-creating machines ranging from a 450 million volt synchrocyclotron to linear accelerators, betatrons, and other specialized devices. The Argonne Cancer Research Hospital, built on the Midway by the Atomic Energy Commission, and operated for it by the university, is specially designed for the medical use of all radioactive sources in investigation and treatment. The new courses will be given in the department of radiology of the university's medical center, under the supervision of Lester S. Skaggs, associate professor of medical physics. Physicists, biologists, and doctors will participate in the instruction. During the second year of the courses, students will be employed half-time either in the university's health physics service or in the department of radiology.

Research Building Dedicated.—The new seven-story Morton Medical Research Building on the Northwestern University Chicago campus will be dedicated at 10:30 a. m. Sept. 27, during the 98th Founders Day ceremonies commemorating the establishment of the medical school. The building was made possible by a bequest of 2 million dollars, left in his memory by the widow of Mr. Joy Morton. Their son, Sterling Morton, chairman of the board of the Morton Salt Co., will make the presentation speech. Physicians participating in the dedicatory ceremonies will include: J. Roscoe Miller, president of the university, Richard H. Young, dean of the medical school, and Smith Freeman, professor and chairman of biochemistry. The building (310 E. Superior St.) is connected to the Montgomery Ward Memorial Building, which houses the medical and dental schools. Its features include movable metal wall partitions, which can be set up at any 10 ft. interval within the building, allowing speedy conversion of laboratories to almost any size. The department of surgery will conduct its research on the top floor, which is connected with the department of anatomy in the Ward building. On the fifth and sixth floors the departments of pharmacology and obstetrics and gynecology are connected to the department of physiology and bacteriology in the Ward building. On the third and fourth floors of the Morton building is the department of medicine; those floors in the Ward building accommodate, in addition to other sections, the department of biochemistry and some of the Montgomery Ward clinics. On the second floor, opposite other of the Ward clinics, are the departments of radiology, urology, and orthopedic surgery and a special radioisotope laboratory. The first floor of the Morton building has facilities for the department of neurology and psychiatry and for clinical art and photography.

Morton Medical Research Building.

INDIANA

Course in Electrocardiography.—The staff of the Robert M. Moore Heart Clinic of Indianapolis General Hospital will give a course in electrocardiography beginning the first Thursday in October. The course, which will be open to all physicians in Indiana, will be held in the Lilly Auditorium at General Hospital 7:30-9 p. m. Further information may be obtained by writing to the Robert M. Moore Heart Clinic, Indianapolis General Hospital, Indianapolis 7.

Personal.—Dr. Raymond M. Rice, who has been affiliated with Eli Lilly and Company since 1936, has been named executive director of medical research. He has been associate director of research since 1951 and before that was director of the medical

Physicians are invited to send to this department items of news of general interest, for example, those relating to society activities, new hospitals, education, and public health. Programs should be received at least three weeks before the date of meeting.

V 1
195

division.——Dr. Frank G. Keller, who has practiced in Alexandria since Jan. 6, 1893, retired in July and will divide his time between Grosse Pointe, Mich., and Lexington, Ky., where his children live. All physicians in Alexandria joined other friends at a farewell dinner July 1.——Dr. Leon T. Bogmenko, a graduate of the Imperial University of Saratov, Russia, and a resident of the United States since 1922, has been named medical and clinical director of the Wabash Valley Sanitarium at Lafayette. Dr. Bogmenko has been affiliated with Cook County Hospital, Chicago, the U. S. War Department, and the Veterans Administration and has served as health officer with the army of occupation in Japan.——Dr. William H. Wood became clinical director of the Norways Foundation Hospital, Indianapolis, July 1.

LOUISIANA

Postgraduate Seminar.—The first annual postgraduate seminar, cosponsored by the Third District Medical Society of Louisiana and the Lafayette Parish Medical Society, will be presented at the Evangeline Hotel in Lafayette, Oct. 1, 9:30 a. m. The program includes the following presentations by guest speakers, all of New Orleans:

Philip M. Tiller, Hormones in General Practice.
Morris Shushan, Liver Disease in Ambulatory Patients.
Richard E. Fowler, Congenital Heart Disease.
Daniel W. Hayes, Problems in Control of Diabetes.
Walter R. Akenhead, Gastrointestinal Bleeding.
Charles J. Miangolarra, Treatment of Hyperthyroidism.
Milton L. McCall, Management of Toxemia of Pregnancy.
John Adriani, Nerve Block in Management of Labor.
George T. Mellinger, Recent Advances in Treatment of Prostatic Disease.
Irving Redler, Recent Advances in Treatment of Fractures.

The program will include lectures, a round-table luncheon, medical motion pictures, and scientific exhibits. An invitation is extended to all interested members of the medical profession. There will be no registration fee. For information write Dr. Arthur A. Stamler, Secretary-Treasurer, Third District Medical Society, 510 St. Landry St., Lafayette.

MICHIGAN

Medical Forums.—In cooperation with the *Detroit Free Press* the Wayne County Medical Society will present "Living with Cancer," the last of three medical forums, Sept. 26, 8:15 p. m., at the Rackham Memorial Auditorium, Detroit.

Personal.—Providence Hospital of Detroit has appointed Dr. Robert I. McClaughry, formerly assistant dean of the Wayne University College of Medicine, Detroit, as director of medical education.——Dr. Elwood A. Sharp, Detroit, director of clinical investigation for Parke, Davis & Company since 1929, has been promoted to medical assistant to the firm's president. Dr. Elmore C. Vonder Heide, associate director of the clinical investigation department, has been named successor to Dr. Sharp. Dr. Sharp served 13 years in the Medical Corps of the United States Navy. Dr. Vonder Heide is on the staff at Harper Hospital and also has been an instructor in internal medicine at Wayne University College of Medicine. He is a director of the Michigan Arthritis and Rheumatism Foundation and medical advisor to the Multiple Sclerosis Foundation.

NEBRASKA

Circuit Course.—The Nebraska State Medical Association will present its fifth traveling postgraduate circuit course in Scottsbluff, Sept. 26; North Platte, Sept. 27; Grand Island, Sept. 28; Norfolk, Sept. 29; Fremont, Sept. 30; and Nebraska City, Oct. 1. According to Dr. William E. Wright, Creighton, president of the association, a nationally known group of doctors will speak on heart, cancer, and tuberculosis. Co-sponsors of the series are the Nebraska Heart Association, Nebraska division of the American Cancer Society, and the Nebraska Tuberculosis Association. All meetings will start at 1 p. m., continue until the dinner hour, and conclude with an evening meeting.

NEW JERSEY

Pediatric Amputee Conference.—A Congenital Child Amputee Conference and Clinic will be held Oct. 1 at the Kessler Institute for Rehabilitation, Pleasant Valley Way, West Orange. "Congenital Malformations and General Principles of Rehabilitation of the Congenital Amputee" will be presented at 10 a. m. by Dr. Henry H. Kessler, medical director, Dr. Earl F. Hoerner, clinical director, and staff specialists. Motion picture films and demonstrations will precede the luncheon hour, and clinic and examination of congenital amputee children will follow it. Congenital amputee children may be medically referred for program and examination. The conference is open to doctors, nurses, limb makers, therapists, and other rehabilitation personnel without charge. Advance registration should be made by calling Miss Joyce M. Collins, ORange 3-6571.

NEW YORK

Research Institute Offers Postgraduate Meetings.—The Chronic Disease Research Institute of the University of Buffalo School of Medicine is sponsoring postgraduate educational meetings for physicians of the Buffalo area during the Fall-Winter season. The opening meeting, Sept. 12, was addressed by Dr. Haqvin Malmros, professor of medicine, University of Lund, in Sweden, whose subject was "The Treatment of Hypercholesterolemia." On Sept. 27, Dr. M. F. Oliver, professor of medicine at the Royal Infirmary in Edinburgh, Scotland, will discuss "Coronary Atherogenesis—An Endocrine Problem?" The meetings, conducted in cooperation with the postgraduate education department of the school of medicine and the Western New York State Heart Association, are presented at 8 p. m. at the University of Buffalo School of Medicine.

Annual District Meeting.—The eighth district branch of the Medical Society of the State of New York will hold its 50th annual scientific session and dinner meeting Sept. 28 at Hotel Niagara in Niagara Falls under the presidency of Dr. Sidney L. McLouth, Corfu. The following program will be presented:

Headache, Francis L. McNaughton, Montreal, Canada.
Recent Advances in Vascular Surgery, Jere W. Lord Jr., New York City.
Changing Aspects of Thyroid Disease, Laurence H. Kyle, Washington, D. C.

Addresses will be made at the dinner meeting by Dr. James Greenough, Oneonta, president-elect of the state medical society, and the guest speaker, Charles A. Brady, Buffalo, professor of English at Canisius College, Buffalo, and literary critic of *The Buffalo Evening News*, whose topic will be "The Physician as Seen in Literature."

Symposium—Emergencies in General Practice.—A symposium, "Emergencies in General Practice," will be presented by the Erie County chapter of the New York State Academy of General Practice and Lederle Laboratories of Pearl River, Oct. 1, at the Hotel Statler, Buffalo. Dr. William H. Merrilees, Lancaster, president of the Erie County chapter, has issued a cordial invitation to all members of the medical profession for Erie County. Dr. Theodore H. Noehren, Buffalo, will serve as moderator for the morning session:

Pediatric Emergencies, Edward Press, Chicago.
Plastic Surgical Principles in Farm, Traffic and Industrial Accidents, James B. Brown, St. Louis.
Modern Management of Common Cardiac Emergencies, William G. Leaman, Philadelphia.

Dr. Garra L. Lester of Chautauqua, president, New York State Academy of General Practice, will address the luncheon session, after which the following program will be offered:

Abdominal Emergencies, William R. McCarty, New York City.
Obstetrical and Gynecological Emergencies, Morris E. Davis, Chicago.
Diagnosis and Treatment of Atomic Injuries, Joe W. Howland, Rochester.

The American Academy of General Practice will allow six formal credit hours.

New York City

Management of Mass Casualties.—A symposium on the management of mass casualties will be presented at the New York Academy of Medicine (2 E. 103rd St.) Sept. 27, 7 p. m., by the academy and the U. S. Army Reserve units—1st Army area—with the cooperation of the Office of the Surgeon General, United States Army, and Army Medical Service Graduate School, Walter Reed Army Medical Center, Washington, D. C. The meeting, which will be cosponsored by the New York and

Brooklyn regional committee on trauma of the American College of Surgeons and by the medical schools of Greater New York, is open to the medical profession, public health officers, and civil defense workers. Major Gen. Silas B. Hays, M. C., U. S. Army, surgeon general, will serve as chairman for the following program:

Weapons' Effects and the Anticipated Medical Problems, Lieut. Col. James B. Hartgering, M.C., chief, department of biophysics, Army Medical Service Graduate School, Walter Reed Army Medical Center.
First Aid and Emergency Medical Care, Lieut. Col. Joseph D. Goldstein, M.C., chief, department of atomic casualties studies, Army Medical Service Graduate School, Walter Reed Army Medical Center.
Hospital Organization, Col. Byron L. Steger, M.C., director, Interagency Institutes for Federal Hospital Administrators, Armed Forces Institute of Pathology, Walter Reed Army Medical Center.
Management of Trauma, Col. Joseph R. Shaeffer, M.C., surgical consultant to the surgeon general, Office of the Surgeon General, department of the Army, Washington, D. C.
Psychological Considerations in Nuclear Warfare, Col. Albert J. Glass, M.C., deputy director, neuropsychiatry division, Army Medical Service Graduate School, Walter Reed Army Medical Center.

NORTH CAROLINA

Heart Symposium.—The Winston-Salem Heart Symposium, sponsored by the Heart Association of Winston-Salem and Forsyth County will be held at the Robert E. Lee Hotel, Winston-Salem, Sept. 30, 9 a. m.-9 p. m. Speakers will be Drs. Charles K. Friedberg, New York, Hugh H. Hussey, Washington, D. C., and Arthur J. Merrill, Atlanta, Ga.

Personal.—Dr. J. Lamar Callaway, Durham, recently made a special tour in the Alaskan Theater of Operations for the U. S. Air Force and Army, during which he also made ward rounds, consulted on special dermatological problems, and lectured to medical personnel. Dr. Callaway was recently elected president of the Society for Investigative Dermatology for 1955-56.—— Dr. Watson S. Rankin, Charlotte, trustee of the Duke Endowment, has been awarded the honorary degree of doctor of science by the University of North Carolina, Chapel Hill. Dr. Rankin has served as a member of the House of Delegates of the American Medical Association, a member of the Council on Health and Public Instruction, and Chairman of the Section on Preventive Medicine and Public Health. He has also been secretary and president of the Conference of State and Provincial Health Authorities of North America and president of the American Public Health Association.

OKLAHOMA

Society News.—Dr. Paul C. Williams, associate professor of orthopedic surgery, Southwestern Medical School of the University of Texas, Dallas, will address the Tulsa Academy of General Practice Sept. 26 at Hotel Tulsa on "Chronic Low Back Pain." Reservations for dinner, 6:30 p. m., may be made by calling LUther 2-5904. The program will be at 8 p. m. All physicians are invited.

SOUTH CAROLINA

Practitioners Meet in Columbia.—The South Carolina Academy of General Practice will hold its annual meeting at the Columbia Hotel in Columbia Sept. 27-28. The program includes presentations by Drs. John A. Prior, Columbus, Ohio, and Robert C. Major, Augusta, Ga.; a seminar on prematurity; and a discussion on office anesthesia and analgesia. An invitation is extended to all members of the South Carolina Medical Association.

TENNESSEE

Conferences on Scientific Fairs.—The Oak Ridge Institute of Nuclear Studies, which is conducting work conferences in cooperation with state academies of science, presented the first conference, the Florida Science Fair Work Conference, at the University of Florida, Gainesville, Aug. 25-26. Other conferences scheduled include: Georgia Work Conference on Science Fairs, University of Georgia, Athens, Sept. 30-Oct. 1; Texas Science Fair Work Conference, University of Texas, Austin, Oct. 6-8; West Virginia Science Fair Work Conference, Jackson's Mill, Weston, Oct. 30-Nov. 1; and North Carolina Science Fair Work Conference, North Carolina State Agricultural and Technical College, Greensboro, Nov. 18-19. The conferences are designed to give inspiration and instruction in the total aspects of science fairs as educational tools for the advancement of science. The conferees will be elementary and secondary school teachers, instructional supervisors, educational administrators, and representatives from institutions of higher learning, industry, and communication mediums.

State Association Revises Postgraduate System.—In changing the type of postgraduate instruction it has been offering for 20 years, the Tennessee State Medical Association will substitute a symposium-type program for its circuit rider course, under which a full-time specialist has traveled over the state presenting lectures in a medical specialty. According to Dr. Frank L. Roberts, associate dean of the University of Tennessee College of Medicine, Memphis, chairman of the symposium committee, the new program will be on a two year trial basis. This year, meetings will be held in 10 cities; next year, 30 meetings will be held. A panel of specialists will present programs designed for general practitioners. The new program, which will offer 12 hours of instruction a year, will be presented from 4 to 6 p. m. and from 7 to 9 p. m. In the middle section of Tennessee the program will be on rheumatic fever in four cities, with the first meeting scheduled for Sept. 28 in Shelbyville. In three cities in eastern Tennessee, beginning Oct. 25 at Cleveland, the program will be on jaundice. The program for western Tennessee (traumatic and emergency surgery) will be held in Jackson, Dec. 7, Dyersburg, Dec. 8, and Memphis, Dec. 9.

GENERAL

Campaign Against Mental Illness.—The National Association for Mental Health has received a $50,000 contribution from the Smith, Kline & French Laboratories, Philadelphia, to help launch, in October, a nationwide campaign to mobilize a "citizens' army against mental illness." A staff of field service experts will work with the association's 33 state member associations and 425 local affiliates.

Psychiatrists Meet at Tulsa.—The annual meeting of the Mid-Continent Psychiatric Association at Western Village Hotel, Tulsa, Okla., Sept. 23-25, has as visiting distinguished guest speakers: Drs. Arnold P. Friedman and Harvey J. Tompkins, New York; Dr. Gordon R. Kamman, St. Paul; Dr. Leslie B. Hohman, Durham, N. C.; Dr. E. Vernon Hahn, Indianapolis; Dr. Dexter M. Bullard, Rockville, Md.; Dr. Abe Hauser, Houston, Texas; Drs. Robert A. Schneider, John Gussen, and Stewart Wolf, Oklahoma City; Dr. Louis A. Schwartz, Detroit; and Dr. H. Holland DeJong, Osawatomie, Kan.

Midwest Regional Librarians.—The Midwest Regional Group of the Medical Library Association will hold its annual fall meeting Oct. 15 at Miles Laboratories in Elkhart, Ind. The program will include talks on phases of current medical research by doctors from the Miles Laboratories and from Notre Dame. After luncheon there will be a general session devoted to library problems, with a panel or symposium, "Temporary vs. Commercial Binding in the Small Library" and another, "Compiling and Using a Procedure Manual in Training New Employees." The chairman of the group is Otilia Goode, A. M. A. Library, Chicago.

Tri-State Medical Meeting.—The Tri-State Medical Society will meet Sept. 28-29 at the Grim Hotel, Texarkana, Ark.-Texas. The session will open Wednesday at 9 a. m. with movies from the American College of Surgeons, after which "The Gallbladder Problem" will be presented by Dr. Robert L. Sanders, Memphis, Tenn., president of the Southern Medical Association, and "Pathology of Gallbladder and Liver" by Dr. William R. Mathews, Shreveport, La. Luncheon will be followed by an address, "The Administration's Medical Program," by Robert L. King, executive assistant to the Vice-President of the United States. Dr. John C. Burch, Nashville, Tenn., president of the Southern Surgical Association, will consider "Indications for Hysterectomy" at 2 p. m. and Dr. Joseph W. Kelso, Oklahoma City, "Technique of Hysterectomy" at 3 p. m. The Tri-State Urologic Society, which will hold its meeting at 2 p. m. Wednesday, will have as guest speaker Dr. James H. DeWeerd, Rochester, Minn.

V 1
195

On Thursday morning Dr. Richard V. Ebert, Little Rock, Ark., will present "Advances in Prevention and Treatment of Heart Disease." The sessions will conclude with a clinicopathological conference, 11 a. m., by Dr. Mathews, with clinical discussion by Dr. Ebert. The meeting is approved for credit by the American Academy of General Practice. Skeet shooting is scheduled for either day of the meeting, and entries in the golf tournament may play on either day.

Prevalence of Poliomyelitis.—According to the National Office of Vital Statistics, the following number of reported cases of poliomyelitis occurred in the United States and its territories and possessions in the weeks ended as indicated:

Area	Sept. 3, 1955: Paralytic Type	Sept. 3, 1955: Total Cases Reported	Sept. 4, 1954, Total

Vermont-New Hampshire Medical Meeting.—The sixth annual combined meeting of the New Hampshire and Vermont state medical societies will convene at the Mount Washington Hotel, Bretton Woods, N. H., Sept. 29-Oct. 1. The following presentations will be made at the general session, Saturday, 2 p. m.:

Carcinoma of the Lung, Edward D. Churchill, Boston.

Retrolental Fibroplasia, Trygve Gundersen, Boston.

Is X-Ray Pelvimetry Feasible and Necessary for the General Practitioner Who is Doing Obstetrics?, Charles M. McLane, New York.

Use of Blood and Its Derivatives in General Practice, Sam T. Gibson, Washington, D. C.

Saturday morning the section on surgery will hear a paper by Dr. Ralph H. Adams, Wolfeboro, N. H., and a panel discussion, "The Surgery of Trauma," with Dr. Churchill as moderator. The section on internal medicine will have as guest speakers, Dr. William Dameshek, Boston, who will discuss "Bone Marrow Failure" and Dr. Sam T. Gibson, Washington, D. C., who will present "Diagnostic Problems in Anemia." Guest speakers at the eye, ear, nose, and throat meeting will be Dr. Gundersen, who will consider "Unusual Congenital Oculomotor Anomalies," and Dr. LeRoy A. Schall, Boston, whose topic will be "Cancer of the Larynx." Dr. James Townsend, chief medical officer, U. S. VA Center, White River Junction, Vt., will speak before the general practice meeting about "Diabetes: Pitfalls in the Management of 'Difficult' Cases."

Pediatricians Meet in Chicago.—The American Academy of Pediatrics will hold its 24th annual meeting at the Palmer House, Chicago, Oct. 1-6. Saturday and Sunday will be devoted to the presentation of 10 seminars. Twenty-two round-table discussions will be held from Monday afternoon through Wednesday morning. The general sessions will open Monday at 9:30 a. m. with a symposium on juvenile delinquency (Dr. Sherman Little, Buffalo, moderator). Dr. Harold E. Harrison, Baltimore, will serve as moderator for the Thursday morning symposium on endocrinology. Clinical sessions will be held Thursday afternoon at Children's Memorial Hospital; Children's Division, Cook County Hospital; Research and Educational Hospitals, University of Illinois; Bobs Roberts Memorial Hospital for Children, University of Chicago; and Sarah Morris Hospital for Children. Admission will be by ticket only ($1, including bus transportation to and from the hospital). The following alumni meetings and special events have been scheduled:

Monday luncheons—Buffalo Children's Hospital Alumni; Cook County Children's Hospital Alumni Group; Alumni of the Pediatric Department of the University of Cincinnati College of Medicine; Columbus Children's Hospital Alumni; and Alumni of the University of Rochester School of Medicine and Strong Memorial Hospital.

Monday dinners, 6:30 p. m.—Babies Hospital Alumni Association (New York) and Children's Memorial Hospital Alumni Banquet; evening meeting—Duke Pediatric Society.

Tuesday dinner and meeting—Children's Medical Center Alumni Group, Boston.

Thursday dinner—Bobs Roberts Memorial Hospital Alumni.

There will be a welcome hour (courtesy M & R Laboratories) Sunday, 6-7:30 p. m.; breakfast (courtesy Libby's Baby Foods) Tuesday, 7-9 a. m.; and reception and cocktail hour (courtesy Mead Johnson & Company) Wednesday, 6-7:30 p. m., preceding the banquet at 8 p. m.

EXAMINATIONS AND LICENSURE

BOARDS OF MEDICAL EXAMINERS

ALABAMA: *Examination.* Montgomery, June 19-21. Sec., Dr. D. G. Gill, State Office Bldg., Montgomery.

ARIZONA:* *Examination.* Phoenix, Oct. 12-14. *Reciprocity.* Phoenix, Oct. 15. Exec. Sec., Mr. Robert Carpenter, 411 Security Bldg., Phoenix.

ARKANSAS:* *Examination.* Little Rock, Nov. 10-11. Sec., Dr. Joe Verser, Harrisburg.

CALIFORNIA: *Written.* Sacramento, Oct. 17-20. *Oral and Clinical Examinations for Foreign Medical School Graduates.* San Francisco, Nov. 13. *Oral Examination for Reciprocity Applications.* San Francisco, Nov. 12. Sec., Dr. Louis E. Jones, Room 536, 1020 N St., Sacramento.

COLORADO:* *Examination.* Denver, Dec. 6-7. Final date for filing application is Nov. 4. *Reciprocity.* Denver, Oct. 11. Final date for filing application is Sept. 12. Exec. Sec., Mrs. Beulah H. Hudgens, 831 Republic Bldg., Denver 2.

CONNECTICUT:* *Regular. Examination.* Hartford, Nov. 8-10. Sec., Dr. Creighton Barker, 160 St. Ronan St., New Haven. *Homeopathic.* Derby, Nov. 8-19. Sec., Dr. Donald A. Davis, 38 Elizabeth St., Derby.

DELAWARE: *Examination.* Dover, Jan. 10-12. *Reciprocity.* Dover, Jan. 19. Sec., Dr. Joseph S. McDaniel, Dover.

FLORIDA:* *Examination.* Miami Beach, Nov. 20-21. Sec., Dr. Homer L. Pearson, 901 N. W. 17th St., Miami.

GEORGIA: *Examination.* Atlanta, Oct. 5-6. *Reciprocity.* Atlanta, Oct. 7. Sec., Mr. R. C. Coleman, 111 State Capitol, Atlanta.

IDAHO: *Examination and Reciprocity.* Boise, Jan. 9-11. Exec. Sec., Mr. Armand L. Bird, 364 Sonna Bldg., Boise.

ILLINOIS: *Examination and Reciprocity.* Chicago, Oct. 11-13. Supt. of Registration, Mr. Fredric B. Selcke, State House, Springfield.

INDIANA: *Examination.* Indianapolis, June. Exec. Sec., Miss Ruth V. Kirk, 538 K. of P. Bldg., Indianapolis.

KANSAS: *Examination and Endorsement.* Topeka, Dec. 7-8. Sec., Dr. Lyle F. Schmaus, New Brotherhood Bldg., Kansas City.

KENTUCKY: *Examination.* Louisville, Dec. 5-7. Asst. Sec., Mr. R. F. Dixon, 620 S. 3rd St., Louisville.

MAINE: *Examination and Reciprocity.* Portland, Nov. 8-9. Sec., Dr. Adam P. Leighton, Portland.

MARYLAND: *Examination.* Baltimore, Dec. 13-16. Exec. Sec., Miss Hannah A. McCarthy, 1215 Cathedral St., Baltimore 1.

MICHIGAN:* *Examination.* Lansing, Oct. 12-14. Sec., Dr. J. Earl McIntyre, 118 Stevens T. Mason Bldg., Lansing.

MINNESOTA:* *Examination and Reciprocity.* Minneapolis, Oct. 18-20. Sec., Dr. F. H. Magney, 230 Lowry Medical Arts Bldg., St. Paul 2.

MISSISSIPPI: *Reciprocity.* Jackson, December. Asst. Sec., Dr. R. N. Whitfield, State Board of Health, Jackson.

MISSOURI: *Examination and Endorsement.* St. Louis, Oct. 21-22. Exec. Sec., Mr. John A. Hailey, Box 4, State Capitol Bldg., Jefferson City.

MONTANA: *Examination and Reciprocity.* Helena, Oct. 4-5. Sec., Dr. Sidney A. Cooney, 7 West 6th Ave., Helena.

NEBRASKA:* *Examination.* Omaha, June 18-20. Director, Bureau of Examining Boards, Mr. Husted K. Watson, 1009 State Capitol Bldg., Lincoln.

NEVADA:* *Examination and Reciprocity.* Reno, Oct. 4. Sec., Dr. G. H. Ross, 112 North Curry St., Carson City.

NEW JERSEY: *Examination.* Trenton, Oct. 18-21. Sec., Dr. Patrick H. Corrigan, 28 W. State St., Trenton.

NEW MEXICO:* *Examination and Reciprocity.* Santa Fe, Nov. 21-22. Sec., Dr. R. C. Derbyshire, 227 E. Palace Ave., Santa Fe.

NEW YORK: *Examination.* Albany, Buffalo, New York City and Syracuse, Oct. 4-7. Sec., Dr. Stiles D. Ezell, 23 S. Pearl St., Albany.

NORTH CAROLINA: *Reciprocity.* Asheville, Oct. 31. Sec., Dr. Jos. J. Combs, 716 Professional Bldg., Raleigh.

NORTH DAKOTA: *Examination.* Grand Forks, Jan. 4-6. *Reciprocity.* Grand Forks, Jan. 7. Sec., Dr. C. J. Glaspel, Box 228, Grafton.

OHIO: *Reciprocity.* Columbus, Oct. 4. *Examination.* Columbus, Dec. 15-17. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OREGON:* *Reciprocity.* Portland, Oct. 13-15. *Examination.* Portland, January. Sec., Mr. Howard I. Bobbitt, 609 Failing Bldg., Portland.

PENNSYLVANIA: *Examination.* Philadelphia, January. Acting Sec., Miss Marguerite G. Steiner, Box 911, Harrisburg.

RHODE ISLAND:* *Examination.* Providence, Oct. 6-7. Administrator of Professional Regulation, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH CAROLINA: *Examination.* Columbia, Nov. 7. Sec., Mr. N. B. Heyward, 1329 Blanding St., Columbia.

SOUTH DAKOTA:* *Examination.* Sioux Falls, Jan. 17-18. Exec. Sec., Mr. John C. Foster, 300 First National Bank Bldg., Sioux Falls.

TENNESSEE:* *Examination.* Memphis, Sept. 28-29. Sec., Dr. H. W. Qualls, 1635 Exchange Bldg., Memphis.

TEXAS:* *Examination and Reciprocity.* Galveston, Dec. 1-3. Sec., Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth 2.

VIRGINIA: *Examination.* Richmond, Dec. 7-9. *Reciprocity.* Richmond, Dec. 6. Final date for filing application is Nov. 21. Address the Secretary, 631 First St. S.W., Roanoke.

WEST VIRGINIA: *Reciprocity.* Charleston, Oct. 10. Sec., Dr. N. H. Dyer, Charleston 5.

WISCONSIN:* *Reciprocity.* Madison, Oct. 21. Sec., Dr. Thomas W. Tormey, Jr., 1140 State Office Bldg., Madison.

WYOMING: *Examination.* Cheyenne, Oct. 3. Sec., Dr. Franklin D. Yoder, State Office Bldg., Cheyenne.

ALASKA:* On application. Sec., Dr. W. M. Whitehead, 172 South Franklin St., Juneau.

GUAM: The Commission on Licensure will meet whenever a candidate appears or submits his credentials. Sec., Dr. John E. Kennedy, Agana.

HAWAII: *Examination.* Honolulu, Jan. 9-12. Sec., Dr. I. L. Tilden, 1020 Kapiolani, St., Honolulu.

VIRGIN ISLANDS: *Examination and Endorsement.* St. Thomas, Nov. 8-9. Sec., Dr. Earle M. Rice, St. Thomas.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ARKANSAS: *Examination.* Little Rock, Oct. 4. Sec., Dr. S. C. Dellinger, Zoology Dept., University of Arkansas, Fayetteville.

CONNECTICUT: *Examination.* New Haven, Oct. 8. Address: State Board of Healing Arts, 258 Bradley St., New Haven 10.

DISTRICT OF COLUMBIA: *Examination.* Washington, Oct. 24-25. Deputy, Mr. Paul Foley, 1740 Massachusetts Ave., N.W., Washington 6.

FLORIDA: *Examination.* Gainesville, Nov. 5. Sec., Mr. M. W. Emmel, Box 340, Gainesville.

IOWA: *Examination.* Des Moines, Oct. 11. Sec., Mr. Ben H. Peterson, Coe College, Cedar Rapids.

MICHIGAN: *Examination and Endorsement.* Detroit and Ann Arbor, Oct. 14-15. Sec., Mrs. Anne Baker, 410 W. Michigan Ave., Lansing 15.

MINNESOTA: *Examination.* Minneapolis, Oct. 4-5. Sec., Mr. Raymond N. Bieter, 126 Millard Hall, University of Minnesota Campus, Minneapolis.

NEBRASKA: *Examination.* Omaha, Oct. 4-5. Director, Bureau of Examining Boards, Mr. Husted K. Watson, 1009 State Capitol Bldg., Lincoln.

NEVADA: *Examination.* Reno, Oct. 4. Sec., Dr. Donald G. Cooney, Box 9005, University of Nevada, Reno.

OREGON: *Examination.* Portland, Dec. 3. Sec., Mr. Charles D. Byrne, State Board of Higher Education, Eugene.

SOUTH DAKOTA: *Examination.* Vermillion, Dec. 2-3. Sec., Dr. Gregg M. Evans, 310 E. 15th St., Yankton.

TEXAS: *Examination.* Austin and Houston, Oct. 21-22. Sec., Brother Raphael Wilson, 407 Perry-Brooks Bldg., Austin.

ALASKA: On application. Juneau or other towns in Territory as decided by Board. *Reciprocity.* On application. Sec., Dr. C. Earl Albrecht, Box 1931, Juneau.

*Basic Science Certificate required.

MEETINGS

AMERICAN MEDICAL ASSOCIATION: Dr. George F. Lull, 535 North Dearborn St., Chicago 10, Secretary.

1955 Clinical Meeting, Boston, Nov. 29-Dec. 2.

1956 Annual Meeting, Chicago, June 11-15.

1956 Clinical Meeting, Seattle, Nov. 27-30.

1957 Annual Meeting, New York, June 3-7.

NATIONAL CONFERENCE ON PHYSICIANS AND SCHOOLS, Moraine-on-the-Lake Hotel, Highland Park, Ill., Oct. 12-14. Dr. W. W. Bauer, 535 N. Dearborn St., Chicago, Director.

ACADEMY OF PSYCHOSOMATIC MEDICINE, Hotel Plaza, New York, Oct. 6-8. Dr. Ethan Allan Brown, 75 Bay State Road, Boston 15, Secretary.

AMERICAN ACADEMY FOR CEREBRAL PALSY, Claridge Hotel, Memphis, Tenn., Oct. 10-12. Dr. Robert A. Knight, 869 Madison Ave., Memphis 3, Tenn., Secretary.

AMERICAN ACADEMY OF NEUROLOGICAL SURGERY, The Homestead, Hot Springs, Va., Oct. 27-29. Dr. Eben Alexander Jr., Bowman Gray School of Medicine, Winston-Salem, N. C., Secretary.

AMERICAN ACADEMY OF OPHTHALMOLOGY AND OTOLARYNGOLOGY, Palmer House, Chicago, Oct. 9-14. Dr. W. L. Benedict, 100 First Avenue Bldg., Rochester, Minn., Executive Secretary.

AMERICAN ACADEMY OF PEDIATRICS, Palmer House, Chicago, Oct. 3-6. Dr. E. H. Christopherson, 610 Church St., Evanston, Ill., Executive Secretary.

AMERICAN ASSOCIATION OF BLOOD BANKS, Palmer House, Chicago, Nov. 19-21. Miss Marjorie Saunders, 3707 Gaston Ave., Dallas 10, Texas, Secretary.

AMERICAN ASSOCIATION OF MEDICAL CLINICS, Curtis Hotel, Minneapolis, Nov. 4-6. Dr. Edwin P. Jordan, Box 58, Charlottesville, Va., Executive Director.

AMERICAN ASSOCIATION OF MEDICAL RECORD LIBRARIANS, LaSalle Hotel, Chicago, Oct. 3-7. Miss Doris Gleason, 510 N. Dearborn St., Chicago 10, Executive Director.

AMERICAN ASSOCIATION FOR THE SURGERY OF TRAUMA, Drake Hotel, Chicago, Oct. 27-29. Dr. James K. Stack, 700 N. Michigan Blvd., Chicago 11, Secretary.

AMERICAN CLINICAL AND CLIMATOLOGICAL ASSOCIATION, The Homestead, Hot Springs, Va., Oct. 31-Nov. 2. Dr. M. N. Fulton, 124 Waterman St., Providence 6, R. I., Secretary.

AMERICAN COLLEGE OF ANESTHESIOLOGISTS, Hotel Statler, Boston, Nov. 4-5. Mr. John H. Hunt, 188 West Randolph St., Chicago 1, Executive Secretary.

AMERICAN COLLEGE OF CARDIOLOGY INTERIM MEETING, Hotel Claridge, Memphis, Tenn., Nov. 10-12. Dr. Philip Reichert, Empire State Bldg., New York 1, Secretary.

AMERICAN COLLEGE OF GASTROENTEROLOGY, Hotel Shoreland, Chicago, Oct. 24-26. Dr. Joseph Shaiken, 33 West 60th St., New York 23, Secretary.

AMERICAN COLLEGE OF SURGEONS, Conrad-Hilton Hotel, Chicago, Oct. 31-Nov. 4. Dr. Michael L. Mason, 40 East Erie St., Chicago 11, Secretary.

AMERICAN DENTAL ASSOCIATION, San Francisco, Oct. 17-20. Dr. Harold Hillenbrand, 222 East Superior St., Chicago 11, General Secretary.

AMERICAN HEART ASSOCIATION, Yung Hotel, New Orleans, Oct. 22-26. Mr. Irving Hexter, 44 East 23d St., New York 10, Secretary.

AMERICAN MEDICAL WOMEN'S ASSOCIATION, Board Meeting, Netherlands-Plaza Hotel, Cincinnati, Nov. 11-13. Miss Lillian T. Majally, 1790 Broadway, New York 19, Executive Secretary.

AMERICAN MEDICAL WRITERS' ASSOCIATION, Jefferson Hotel, St. Louis, Sept. 30-Oct. 1. Dr. Harold Swanberg, P.O. Drawer 110, Quincy, Ill., Secretary.

AMERICAN PUBLIC HEALTH ASSOCIATION, Muehlebach Hotel and Municipal Auditorium, Kansas City, Mo., Nov. 14-18. Dr. Reginald M. Atwater, 1790 Broadway, New York 19, Executive Secretary.

AMERICAN SCHOOL HEALTH ASSOCIATION, Hotel President, Kansas City, Mo., Nov. 14-18. Dr. A. O. DeWeese, 515 East Main St., Kent, Ohio, Secretary.

AMERICAN SOCIETY OF ANESTHESIOLOGISTS, Hotel Statler, Boston, Oct. 29-Nov. 3. Dr. J. Earl Remlinger Jr., Room 1101, 188 W. Randolph St., Chicago 1, Secretary.

AMERICAN SOCIETY OF CLINICAL PATHOLOGISTS, Drake Hotel, Chicago, Oct. 10-15. Dr. Clyde G. Culbertson, 1040-1232 West Michigan St., Indianapolis, Secretary.

AMERICAN SOCIETY OF PLASTIC AND RECONSTRUCTIVE SURGERY, Atlantic City, N. J., Sept. 25-30. Dr. Kenneth L. Pickrell, Duke Hospital Durham, N. C., Secretary.

OMAHA MID-WEST CLINICAL SOCIETY, Hotel Paxton, Omaha, Oct. 24-27. Mrs. Anne K. Ramsey, 1031 Medical Arts Bldg., Omaha 2, Executive Secretary.

OREGON STATE MEDICAL SOCIETY, Hotel Heathman, Portland, Sept. 28-Oct. 1. Dr. Richard R. Carter, 1020 S.W. Taylor St., Portland 5, Secretary.

POSTGRADUATE ASSEMBLY IN ENDOCRINOLOGY AND METABOLISM, Indianapolis, Sept. 26-Oct. 1. Dr. John J. Mahoney, Assistant Dean, Indiana University School of Medicine, 1040 W. Michigan St., Indianapolis 7.

REGIONAL MEETINGS, AMERICAN COLLEGE OF PHYSICIANS:

Billings, Mont., Oct. 7-8. Dr. Harold W. Gregg, 103 North Wyoming St., Butte, Governor.

Charleston, S. C., Oct. 7-8. Dr. Robert Wilson, 165 Rutledge Ave., Charleston, S. C., Governor.

Buffalo, N. Y., Oct. 14. Dr. John H. Talbot, 100 High St., Buffalo 3, N. Y., Governor.

Madison, Wis., Oct. 15. Dr. Frederick W. Madison, 425 East Wisconsin Ave., Milwaukee 2, Governor.

Louisville, Ky., Nov. 5. Dr. Sam A. Overstreet, 332 West Broadway, Louisville, Ky., Governor.

Newark, N. J., Nov. 9. Dr. Edward C. Klein Jr., 6 S. Kingsman Rd., South Orange, N. J., Governor.

SOCIETY OF CLINICAL SURGERY, Hotel Roosevelt, New Orleans, Nov. 11-12. Dr. Frank F. Allbritten Jr., University of Kansas Medical Center, Kansas City, Mo., Secretary.

SOUTHERN MEDICAL ASSOCIATION, Shamrock Hotel, Houston, Texas, Nov. 14-17. Mr. V. O. Foster, 1020 Empire Bldg., Birmingham 3, Ala., Secretary-Manager.

SOUTHERN SOCIETY OF CANCER CYTOLOGY, Houston, Texas, Nov. 14-17. Dr. J. Ernest Ayre, 1155 N.W. 14th St., Miami, Fla., Secretary.

SOUTHWESTERN MEDICAL ASSOCIATION, Phoenix, Ariz., Nov. 16-18. Dr. Celso C. Stapp, 800 Montana St., El Paso, Texas, Secretary.

STATE MEDICAL JOURNAL CONFERENCE, Chicago, Nov. 7-8. Mr. Alfred J. Jackson, 535 N. Dearborn St., Chicago 10, Director.

TENNESSEE VALLEY MEDICAL ASSEMBLY, Read House, Chattanooga, Tenn., Oct. 3-4. Dr. Harry E. Jones, 109 Medical Arts Bldg., Chattanooga 2, Tenn., Secretary.

THE CONSTANTINIAN SOCIETY, Sheraton-Park Hotel, Washington, D. C., Oct. 26-29. Dr. C. F. Shook, P. O. Box 1035-36, Toledo 1, Ohio, Secretary.

TRI-STATE MEDICAL SOCIETY, Grim Hotel, Texarkana, Tex., Sept. 28-29. Dr. Karlton H. Kemp, 408 Hazel St., Texarkana, Ark., Secretary.

VERMONT STATE MEDICAL SOCIETY, Mt. Washington Hotel, Bretton Woods, N. H., Sept. 29-Oct. 1. Dr. James P. Hammond, 337 South St., Bennington, Secretary.

VIRGINIA, MEDICAL SOCIETY OF, Hotel Jefferson, Richmond, Oct. 16-19. Mr. Robert I. Howard, 105 West Franklin St., Richmond, Executive Secretary.

WESTERN ORTHOPEDIC ASSOCIATION, The Reef, Honolulu, Hawaii, Nov. 7-10. Dr. Ivar J. Larsen, 1133 Punchbowl, Honolulu 13, Hawaii, Secretary.

WESTERN SOCIETY OF ELECTRO-ENCEPHALOGRAPHY, Westward Ho Hotel, Phoenix, Ariz., Nov. 10-12. Dr. Sylvester N. Berens, 902 Boren Ave., Seattle, Secretary.

FOREIGN AND INTERNATIONAL

CANADIAN SOCIETY FOR THE STUDY OF FERTILITY, Royal York Hotel, Toronto, Ont., Canada, Oct. 6-8. Dr. Earl R. Plunkett, 469 Waterloo St., London, Ont., Canada, Secretary.

CONFERENCE OF INTERNATIONAL UNION FOR HEALTH EDUCATION OF THE PUBLIC, Rome, Italy, Apr. 27-May 5, 1956. Mr. Lucien Viborel, 92 rue St. Denis, Paris 1er, France, Secretary-General.

CONGRESS OF INTERNATIONAL ASSOCIATION OF LIMNOLOGY, Helsinki, Finland, July 26-Aug. 7, 1956. For information address: Dr. H. Luther, Snellmansgatan 16 C 36, Helsinki, Finland.

CONGRESS OF INTERNATIONAL ASSOCIATION OF LOGOPEDICS AND PHONIATRICS, Barcelona, Spain, Sept. 3-7, 1956. Dr. J. Perello, Provenza 319, Barcelona 9, Spain, Secretary-General.

CONGRESS OF INTERNATIONAL SOCIETY OF HEMATOLOGY, Hotel Statler, Boston, Mass., U.S.A., Sept. 3-8, 1956. Dr. W. C. Moloney, 39 Bay State Road, Boston, Mass., U.S.A., Secretary.

CONGRESS OF INTERNATIONAL SOCIETY FOR RESEARCH ON ANESTHESIA, Miami Beach, Fla., U.S.A., Mar. 12-15, 1956. For information write: Dr. R. J. Whitacre, 13951 Terrace Road, Cleveland 12, Ohio, U. S. A.

CONGRESS OF INTERNATIONAL UNION AGAINST VENEREAL DISEASES, Naples, Italy, Sept. 25-28. For information address: Prof. Monacelli, University of Naples, Dept. of Dermatology, Naples, Italy.

CONGRESS OF LATIN SOCIETY OF OPHTHALMOLOGY, Madrid, Spain, April 24-28, 1956. For information address: Dr. Costi, Montalban 3, Madrid, Spain.

EUROPEAN CONGRESS OF ALLERGOLOGY, Florence, Italy, May 1956. Prof. Umberto Serafini, Largo della Gancia 5, Rome, Italy, Secretary-General.

EUROPEAN SYMPOSIUM ON VITAMIN B12, Hamburg, Germany, May 1956. For information write: Doz. Dr. H. Bauer, Nervenklinik, Hamburg-Eppendorf, Germany.

INTERNATIONAL ACADEMY OF LEGAL AND SOCIAL MEDICINE, Plenary Conference, Genoa, Italy, Oct. 13-17. Prof. Domenico Macaggi, Institut de Medicine legale, Universite de Genes, Genes, Italy, President.

INTERNATIONAL ACADEMY OF PATHOLOGY, Cincinnati, Ohio, U. S. A., April 24-25, 1956. Dr. F. K. Mostofi, Armed Forces Institute of Pathology, Washington 25, D. C., U. S. A., Secretary.

INTERNATIONAL CONGRESS OF ALLERGOLOGY, Rio de Janeiro, Brazil, S. A., Nov. 6-13. Dr. Bernard N. Halpern, 197 boulevard St. Germain, Paris 7e, France, Secretary General.

INTERNATIONAL CONGRESS OF ANTHROPOLOGICAL AND ETHNOLOGICAL SCIENCES, Philadelphia, Pa., U. S. A., Sept. 2-9, 1956. Dr. William N. Fenton, National Research Council, Division of Anthropology and Psychology, 2101 Constitution Avenue, Washington 25, D. C., U. S. A., Secretary-General.

INTERNATIONAL CONGRESS FOR THE HISTORY OF SCIENCE, Florence and Milan, Italy, Sept. 3-10, 1956. Dr. M. L. Bonelli, Instituto di Ottica, Arcetri, Florence, Italy, Secretary-General.

INTERNATIONAL CONGRESS OF HYDATID DISEASE, Athens, Greece, Sept. 14-18, 1956. Prof. B. Kourias, Croix-Rouge Hellenique, 1 rue Mackenzie King, Athens, Greece, Secretary-General.

INTERNATIONAL CONGRESS OF INTERNAL MEDICINE, Madrid, Spain, Sept. 19-23, 1956. Dr. J. C. De Oya and Dr. J. Gimena, Hostaleza No. 90, Madrid, Spain, Secretaries.

INTERNATIONAL CONGRESS OF INTERNATIONAL COLLEGE OF SURGEONS, Buenos Aires, Argentina, S. A., Nov. 19-24, 1956. Dr. Max Thorek, 1516 Lake Shore Drive, Chicago, Illinois, U. S. A., Secretary-General.

INTERNATIONAL CONGRESS OF INTERNATIONAL SOCIETY OF BRONCHOESOPHAGOLOGY, Buenos Aires, Argentina, S. A., Oct. 28-29. Dr. Juan Carlos Arauz, Cangallo 4015, Buenos Aires, Argentina, S. A., Secretary General.

INTERNATIONAL CONGRESS OF MEDICAL PROFESSIONAL JURISDICTION, MEDICAL ETHICS, AND COMPARATIVE MEDICAL LAW, Paris, France, Sept. 30-Oct. 3. Dr. J. R. DeBray, Conseil National de L'Ordre des Médecins, 60, Boulevard Latour-Maubourg, Paris 7e, France, Secretary General.

INTERNATIONAL CONGRESS OF NEO-HIPPOCRATIC MEDICINE, Montecatini, Terme, Italy, May 20-22, 1956. Prof. P. Delore, 13 rue Jarente, Lyon, France, Secretary-General.

INTERNATIONAL CONGRESS OF PAEDIATRICS, Copenhagen, Denmark, July 22-27, 1956. Professor P. Plum, Rigshospitalet, Copenhagen, Denmark, President.

INTERNATIONAL CONGRESS OF PHYSICAL MEDICINE, Copenhagen, Denmark, August 20-24, 1956. Dr. B. Strandberg, Kobenhavns amts sygehus i Gentofte, Dept. of Rheumatology and Physical Medicine, Hellerup, Denmark, Honorable Secretary.

INTERNATIONAL CONGRESS OF RADIOLOGY, Mexico, D. F., Mexico, July 22-28, 1956. Dr. Jose Noriega, Tepic 126 (2e piso), Mexico, D. F. 7, Mexico, Secretary General.

INTERNATIONAL CONGRESS OF WORLD CONFEDERATION FOR PHYSICAL THERAPY, New York, New York, U. S. A., June 17-23, 1956. For information address: Miss Mildred Elson, American Physical Therapy Association, 1790 Broadway, New York 19, New York, U. S. A.

INTERNATIONAL GENERAL MEDICAL CONGRESS, University of Rosario Medical College, Rosario, Argentina, S. A., Nov. 7-12. Dean Jose Imhoff, Santa Fé 3100, Rosario, Argentina, S. A., Chairman.

INTERNATIONAL PHYSIOLOGICAL CONGRESS, Brussels, Belgium, July 29-Aug. 5, 1956. For information address: Prof. J. Reuse, Faculte de Medicine et de Pharmacie, 115 Boulevard de Waterloo, Brussels, Belgium.

INTERNATIONAL PROFESSIONAL UNION OF GYNECOLOGISTS AND OBSTETRICIANS, Madrid, Spain, Sept. 28-29, 1956. Dr. Jacques Courtois, 1 rue Racine, St-Germain-en-Laye (S and O), France, Permanent International Secretary-General.

NORTH QUEENSLAND MEDICAL CONFERENCE, Cairns, North Queensland, Australia, June 25-30, 1956. Dr. W. R. Horsfall, P. O Box 672, Cairns, N.Q., Australia, Secretary.

PAN AMERICAN CONGRESS OF INTERNATIONAL COLLEGE OF SURGEONS, Mendoza City, Argentina, S. A., Oct. 22-26. For information address: Secretary, Casetos Av. 2154, Buenos Aires, Argentina, S. A.

PAN AMERICAN CONGRESS OF OPHTHALMOLOGY, Santiago, Chile, S. A., Jan. 9-14, 1956. Dr. Rene Contardo, Huerfanos 930, Of. 74, Santiago, Chile, Secretary General.

PAN AMERICAN MEDICAL SOCIAL CONVENTION, Bogota, Colombia, S. A., Oct. 15-22. Dr. Leopoldo E. Araujo, Avenida de los Presidentes Num. 506, Apartado 2589, La Habana, Cuba, Secretary.

PAN AMERICAN MEDICAL WOMEN'S ALLIANCE, Santiago, Chile, March 6-13, 1956. For information address: Dr. Eva Cutright, 458 Beall Ave., Wooster, Ohio, U. S. A.

VENEZUELAN CONGRESS OF MEDICAL SCIENCES, Caracas, Venezuela, S. A., Nov. 18-26. Dr. A. L. Briceno Rossi, Apartado 4412, Ofic. del Este, Caracas, Venezuela, S. A., Secretary General.

WORLD CONGRESS ON FERTILITY AND STERILITY, Naples, Italy, May 18-26, 1956. For information address: Prof. G. Tesauro, S. Andrea della Dame, 19, Naples, Italy.

MAGAZINE–TELEVISION REPORT

The following list of current medical articles in mass-circulation magazines and forthcoming network television programs on medical subjects is published each week only for the information of readers of THE JOURNAL. *Unless specifically stated, the American Medical Association neither approves nor disapproves of the articles and programs reported.*

TELEVISION

Sunday, Sept. 25

NBC-TV, 2 p. m. EDT. "American Inventory" presents "The Days Grow Long," which dramatizes the need for a new attitude on the part of all Americans toward the country's growing number of older people and their problems.

Monday, Sept. 26

NBC-TV, 9 p. m. EDT. "Medic" features the first of two episodes on postpartum psychosis. Titled "And There Was Darkness," the first episode shows a young mother so depressed after the birth of a baby that she asks to be admitted to a mental hospital.

ABC-TV, 9:30 p. m. EDT. "Medical Horizons," presented in cooperation with the American Medical Association, will originate from Kessler Institute, West Orange, N. J. The report will show advanced methods of treating the handicapped individual, with emphasis on a multidisciplined approach.

Wednesday, Sept. 28

NBC-TV, 11:30 a. m. EDT. "Medical and Health News with Howard Whitman," a segment of the "Home" program.

MAGAZINES

Look, Sept. 20 and Oct. 4, 1955

"The Mentally Ill Tell Their Own Story," by Roland Berg

In a two-part article, *Look's* medical editor and a staff photographer report on their visit to St. Elizabeth's Hospital, Washington, D. C., giving in words and pictures an insight on current diagnosis and therapy.

Parade, Sept. 25, 1955

"Polio Report," by Robert Goldman

"Right now there is no reason to defer your child's inoculation with Salk vaccine in hopes of 'something better' tomorrow or next month. As with other immunizing agents, research on polio must continue slowly, painstakingly for perhaps several years. But it may be predicted safely that one day a greatly improved virus, tested and approved, will be ready for release."

Farm Journal, September, 1955

"Your Medical Check-up," by Caroline A. Chandler, M.D.

Every woman needs "regular and complete medical checkups spaced according to her age and according to the doctor's recommendation. . . . If your doctor doesn't go along with the idea . . . you have the wrong doctor!"

Pageant, October, 1955

"A New Look at Mental Illness," by Lawrence Galton

The author tells of new drugs and new treatments for the mentally ill. Under drugs, he mentions chlorpromazine and reserpine, glutamine for epilepsy, Metrazol and niacin for reducing confusion in older patients, and Miltown for helping "tense and anxious patients." Under treatments, the author reports on trends in treating mental patients outside of institutions in England, Belgium, and the United States.

"Watch Your Next Operation"

A photographic feature that gives a patient's eye view of procedures before and after an operation.

"America Is Catching Spockitis," by David R. Lindsay

A personality sketch of Dr. Benjamin Spock and his family.

Coronet, October, 1955

"Fluoridation: Is It Safe?" by James Rorty

The author says that the "tide seems to be swinging towards the opponents of the (fluoridation) program. . . . They hold that far from being a public health boon of demonstrated safety and value, fluoridation is a dubious and inadequately tested venture into mass medicine. They argue that it is without precedent in public health history to apply such a wholesale program on the basis of such meager investigations of its safety and effectiveness."

"285 Years of Medicine"

Biographical sketches of four elderly medical doctors: 89-year-old Dr. William Vroom, 93-year-old Dr. William L. Warriner, 97-year-old Dr. Maurice J. Lewi, and 101-year-old Dr. Frederick B. Streeter.

DEATHS

Allen, Charles Alexander, Washington, D. C.; Howard University College of Medicine, Washington, 1910; for many years on the staff of the Freedmen's Hospital; died Aug. 14, aged 70, of congestive heart disease.

Brabham, James Charles ✦ McColl, S. C.; Medical College of South Carolina, Charleston, 1934; engaged for many years in public health work, first in South Carolina and later in Mississippi; died July 18, aged 46.

Burnside, Isaac Marion, Los Angeles; Marion-Sims Beaumont Medical College, St. Louis, 1899; served on the staff of the Hollywood Presbyterian Hospital; died in Burbank July 2, aged 82, of coronary occlusion.

Cavanagh, John Leslie ✦ Carlsbad, N. M.; University of Toronto Faculty of Medicine, Toronto, Canada, 1923; interned at the Riverdale Isolation Hospital and Hospital for Sick Children in Toronto, and the Lutheran Hospital in Brooklyn; served with the Canadian Expeditionary Force during World War I; died April 10, aged 58, of coronary occlusion.

Corlett, Thomas Gardiner ✦ Colorado Springs, Colo.; University of Buffalo (N. Y.) School of Medicine, 1890; died in the Glockner Hospital Aug. 13, aged 87.

Culver, George Albert ✦ Galveston, Texas; University of Texas School of Medicine, Galveston, 1945; interned at the Gorgas Hospital in Ancon, Canal Zone; served as associate professor of anesthesiology at Baylor University College of Medicine in Houston; on the faculty of his alma mater, now known as the University of Texas Medical Branch; on the staff of the John Sealy Hospital and affiliated hospitals; died May 17, aged 33, of coronary thrombosis.

Du Bois, Franklin Thomas ✦ Liberty, Ind.; University and Bellevue Hospital Medical College, New York City, 1899; veteran of the Spanish-American war; served as county health officer and coroner; died July 2, aged 85, of senility.

Frost, Edward Harold ✦ Willmar, Minn.; Louisville (Ky.) Medical College, 1899; for a time vice-president of the Minnesota State Medical Association; past-president of the Great Northern Railway Surgeons Association; held a position on the school board for many years; a city health officer and division surgeon of the Great Northern Railroad; at one time county coroner; past-chief of staff of the Rice Memorial Hospital; died June 2, aged 79, of coronary occlusion.

Gates, Arthur Marion ✦ Ararat, Va.; Medical College of Virginia, Richmond, 1919; member of the Medical Society of Virginia; coroner for Dan River District, Patrick County; died July 4, aged 63, of pulmonary embolism.

Greaves, Horatio Norman, Champaign, Ill.; American Medical Missionary College, Battle Creek, Mich., and Chicago, 1906; Rush Medical College, Chicago, 1907; on the staff of the Burnham City Hospital; died July 31, aged 74.

Henry, Tully Lee, Wilburton, Okla.; College of Physicians and Surgeons, Little Rock, Ark., 1910; died July 27, aged 69, of coronary occlusion.

Hilton, Walter Scott, Tiffin, Ohio; Starling Medical College, Columbus, 1896; died in the Mercy Hospital June 12, aged 90, of carcinoma of the prostate and an injury received in a fall.

Johnson, George Frederick ✦ Montalvo, Calif.; St. Louis College of Physicians and Surgeons, 1896; first mayor of East Moline, Ill., and served in that position for 14 years; veteran of World War I; died Aug. 6, aged 82, of arteriosclerosis and diabetes mellitus.

Klaptoz, Adalbert ✦ Chicago; Medizinische Fakultät der Universität, Vienna, Austria, 1910; was frozen to death in a blizzard near Linz, Austria, while mountain climbing Aug. 8, aged 69.

✦ Indicates Member of the American Medical Association.

Kretzmer, Eugene ✦ Worcester, Mass.; Ludwig-Maximilians-Universität Medizinische Fakultät, München, Bavaria, Germany, 1908; served with the German Army during World War I; died in Fairlawn Hospital July 20, aged 72.

Lambert, Joseph S., Chicago; Northwestern University Medical School, Chicago, 1893; on the staff of the Englewood Hospital; died Aug. 8, aged 88, of chronic myocarditis.

McClellan, P. T. ✦ Vero Beach, Fla.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1910; served as health officer; died in the Indian River Memorial Hospital June 10, aged 78, of aplastic anemia.

Mitchell, William James ✦ Chicago; Rush Medical College, Chicago, 1903; died in the Woodlawn Hospital July 28, aged 73, of a cerebrovascular accident.

Nuzum, John Weston Jr. ✦ New Orleans; Northwestern University Medical School, Chicago, 1951; certified by the National Board of Medical Examiners; member of the Illinois State Medical Society; formerly a resident at the Augustana Hospital in Chicago; served as a first lieutenant in the U. S. Air Force; resident at the Charity Hospital of Louisiana, where he interned; died Aug. 15, aged 29.

O'Dea, Patrick John, Sacramento, Pa.; College of Physicians and Surgeons, Baltimore, 1898; an associate member of the American Medical Association; on the staffs of the West Side and Mercy hospitals; died July 14, aged 80, of heart disease.

Petry, Franklin, Lowell, Ind.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1901; died in the Porter Memorial Hospital, Valparaiso, April 3, aged 81, of abdominal cancer.

Pohly, Albert G., New York City; University of the City of New York Medical Department, 1891; member of the Medical Society of the State of New York; for many years physician for the board of education; served on the staffs of the Lenox Hill Hospital and the Mount Sinai Hospital, where he died Aug. 10, aged 85, of adenocarcinoma of the stomach.

Rubbra-Morris, Jean Olive, Billings, Mont.; University of Kansas School of Medicine, Kansas City, 1945; interned at St. Margaret's Hospital in Kansas City, Kan.; formerly a resident at the Kansas City (Mo.) General Hospital, and the Research and Educational Hospitals in Chicago; on the staff of St. Vincent Hospital; died July 4, aged 34.

Scruton, Foster David, Detroit; University of Michigan Medical School, Ann Arbor, 1914; on the staff of the Detroit Memorial Hospital; died in Monterey Park, Calif., June 6, aged 69, of hypertensive cardiovascular disease.

Stern, Nathan ✦ Indianapolis; Medical College of Indiana, Indianapolis, 1904; served during World War I; on the staff of St. Vincent's Hospital; died July 18, aged 74, of coronary occlusion and arteriosclerosis.

True, MaBelle, Topeka, Kan.; Kansas Medical College, Medical Department of Washburn College, Topeka, 1897; died Aug. 2, aged 83, of a cerebral vascular accident.

Weiner, Samuel Isaac ✦ Chicago; University of Illinois College of Medicine, Chicago, 1925; on the staff of Mount Sinai Hospital; died July 9, aged 58.

White, James R., Chicago; Meharry Medical College, Nashville, Tenn., 1897; served during World War I, when he received the Croix de Guerre from France; on the staff of the Provident Hospital; died at a resort near Mears, Mich., July 26, aged 84, of coronary occlusion.

Yarian, Norman Carey ✦ Cleveland; University of Wooster Medical Department, Cleveland, 1896; on the staffs of the Lutheran and Lakewood (Ohio) hospitals; died in Bay Village, Ohio, July 28, aged 84, of uremia.

FOREIGN LETTERS

AUSTRIA

Retarded Elimination of Hydrocortisone.—At the June 16 meeting of the Society of Internal Medicine of Vienna, Geyer and Keibl described their observations on the elimination of injected hydrocortisone in healthy persons and in patients with liver disease and showed that the decomposition of this hormone is greatly retarded in liver diseases. Parenchymal diseases of the liver and biliary obstructions showed the same behavior in this respect. The results demonstrate the importance of the liver in the decomposition of the adrenal cortical hormones.

Hepatic Circulation.—At the same meeting Neumayr and Vetter demonstrated once more the clinical value of the nonsurgical method for ascertaining the hepatic circulation in human beings with the aid of colloidal radioactive gold. Investigations on 15 patients in whom the hepatic minute volume was ascertained simultaneously with radioactive gold and bromsulphalein revealed that the radioactive gold method revealed values that were on the average 15.6% lower than those obtained with the bromsulphalein method. An attempt was made to show that the radioactive gold method reveals values that correspond more closely to the actual quantities of blood in the hepatic circulation than do those obtained with bromsulphalein. This is especially true in patients with functional disturbances in the hepatic parenchyma.

Influencing of the Menstrual Cycle.—At the meeting of the Society of Physicians in Vienna on June 17, Dr. V. Grünberger stated that female patients often express the wish for a postponement of their menstrual cycles because of vacation, competitive sports, or polymenorrhea. Sixty women with polymenorrhea and with normal menstrual cycles were treated with estrogens. The treatment of choice was 20 mg. of the synthetic preparation dienestrol (Retalon) on the fourth and sixth days of the cycle. In 70% of the patients with polymenorrhea and in 87% of the women with a normal cycle, the onset of the next period was postponed for an average of six to seven weeks. At any time, the amenorrhea could be brought to an end by giving the patient two 25 mg. doses of progesterone. Successive menstrual cycles did not show any disturbance. In several patients with polymenorrhea, treatment was followed by a regulation of the menstrual cycle. In only one patient, a woman with glandular-cystic hyperplasia, long-continued bleeding occurred.

Functional Urinary Incontinence.—At a meeting of the Austrian Society of Gynecologists and Obstetricians in Vienna in June, Brandstetter and Gritsch reported that variations of the sphincteral power of the bladder depending on phases of the menstrual cycle may be observed in continent as well as in incontinent women with normal menstruation. The sphincteral capacity is measured as the difference in pressure between the bladder at rest and during squeezing of the bladder by contractions of voluntary muscles. In continent women one may find differences in positive pressure only, depending on phases of the menstrual cycle, while in incontinent women an observed negative difference in pressure may be abolished or turned into a positive difference in pressure at the time of the highest estrogen activity, but only in women in whom the negative difference in pressure is not too great. This makes possible the detection of functional urinary incontinence in women by distinguishing a temporary and a permanent incontinence.

BRAZIL

Total Gastrectomy.—In the third volume of *Publicações da Casa de Saude São Miguel* of Rio de Janeiro, Dr. Fernando Paulino and his co-workers reported 20 total gastrectomies performed in the last five years with no operative deaths. In 15 patients the pathological diagnosis was adenocarcinoma of the stomach, in 3 it was scirrhous carcinoma, in one it was lymphosarcoma, and in one squamous cell epithelioma of the esophagus extending into the stomach. In a follow-up of 19 of these patients, 10 had died; of these 3 lived more than one year. After a period of adaptation of three to six months, they enjoyed until their death a relatively normal life, free from pain and without dietary restrictions. Seven patients died within 10 months after operation. In this group the patients suffered from pain, vomiting, and nutritional disturbances. Of the nine patients still living, one had survived the operation for 30 months and another for 16 months. Both lead a normal life, without dietary restrictions. The other seven patients had been operated on for less than 10 months. Although this series is relatively small, the authors believe that, whenever possible, subtotal gastrectomy is the operation of choice, because, as compared with total gastrectomy, it provides a more comfortable postoperative period, even though the lesion recurs later. Total gastrectomy should be reserved for patients in whom a subtotal operation would not permit wide excision of all malignant tissue.

Acute Leukemia.—Two patients with acute leukemia predominantly localized in the kidneys were reported by Dr. Silvio Jordão and his co-workers in the *Archives of the Hospital Central da Santa* (March 1, 1955). In the hematological study the authors emphasized the presence of immature and undifferentiated cells that cannot be classified in the normal blood series. According to Maffei this cell is a polyblast. It is also called a microhistiocyte, lymphocytoid cell, microhemocytoblast, and micromyeloblast. The authors agree with Carballo and Rohr regarding the value and position of Ferrata's hemohistioblast in the cell differentiation scale. For them only two cells are undoubtedly of value in the hematological picture of acute leukemia: the polyblast and the hemocytoblast. According to a new pathological concept of this disease, sponsored by the authors, the diagnosis is made by the identification of immature elements, regardless of their topographic distribution. Thus, this disease should be considered as a hyperplasia of the reticuloendothelial system, therefore a systemic disease.

ENGLAND

Cancer Research.—The Annual Report of the British Empire Cancer Campaign for 1954 is based on reports from 15 research institutions in this country and from individual workers and research institutions in Canada, Australia, and New Zealand. At the Chester Beatty Institute the whole tar from cigarette smoke and the neutral fraction have been applied to the skin for 18 months in five strains of mice, with a completely negative result to date. This suggests at most that any carcinogenic properties possessed by the tars are mild. In other experiments in which mice have been exposed for long periods to cigarette smoke the induction of lung cancer has not been observed. As this may simply be due to the unsuitability of this particular species, condensates from cigarette smoke and from cigarette paper smoke have also been examined for the presence of carcinogenic hydrocarbons and, in particular, 3:4-benzopyrene. In the case of the smoke condensate from cigarette paper, examination of a large series of fractions has led to the detection of 3:4-benzopyrene by methods based on photographic fluorescence and to its clear confirmation by the use of the Cary spectrophotometer. No estimate of the amount present has so far been made. In Glasgow, experiments to test the carcinogenic action of tar obtained from mechanically smoked cigarettes, administered over prolonged periods by feeding and by direct injection into the lungs of mice, and of tobacco tars produced under conditions as nearly as possible resembling those in ordinary smoking have proved negative. At the London Hospital, cigarette tobacco extracts obtained from the butts of naturally smoked cigarettes have also proved inactive in tests for carcinogenic, initiating and promoting, action.

The items in these letters are contributed by regular correspondents in the various foreign countries.

Nitrogen Mustard.—At the Chester Beatty Research Institute, 43 patients have been treated with the aromatic nitrogen mustard-CB 148, including 15 with Hodgkin's disease, 8 with disseminated lymphosarcoma, and 5 with lymphocytic leukemia. The daily oral dose was 0.1 to 0.3 mg. per kilogram of body weight for periods up to four months. Thirteen of the patients with Hodgkin's disease showed some response, but only two derived substantial clinical benefit. Responses of value have also followed treatment in four of five patients with giant follicular lymphoma and in a few of those with lymphocytic leukemia. Side-effects of nitrogen mustard-CB 148 are less than with nitrogen mustard-HN 2 and triethylene melamine. Although this new nitrogen mustard is a powerful bone marrow depressant, serious damage should be avoidable.

At the Westminster Hospital, nitrogen mustard-CB 148 has been used in 39 patients; 24 with Hodgkin's disease, 2 with lymphosarcoma, 3 with lymphocytic leukemia, 2 with granulocytic leukemia, 4 with plasma cell myeloma, and 3 with generalized carcinomatosis. Good temporary palliation has been achieved in many of the patients. Ten patients with advanced Hodgkin's disease and one with chronic lymphocytic leukemia have been treated with actinomycin but with little clinical control of the disease. Nitrogen mustard has been found to be the most useful drug for the control of plasma cell myeloma. Triethylene melamine has on occasion been used as an alternative to nitrogen mustard, but the remissions obtained with it have not been considered superior to those obtained with nitrogen mustard.

Polycythemia Vera.—At the Chester Beatty Institute in the last six years 49 patients with polycythemia vera have been treated with radioactive phosphorus. No side-effects or radiation reactions have been encountered. In 28 patients the phosphorus was given in two doses, at an interval of 6 to 12 weeks, the average dose being 5 mc. followed by 4 mc. Of these patients, 23 responded satisfactorily, 2 have not responded, one has anemia, one has anemia or leukemia, one has died of leukemia, and 2 could not be traced. In 21 patients, the phosphorus was given in a single injection of 4 to 7 mc. Of these, 15 have responded satisfactorily, one is resistant, 3 have died (one from a cerebral accident, one from heart failure, and one from osteosclerosis myelofibrosis), and 2 could not be traced. A review of 64 patients with chronic granulocytic leukemia treated in the last 17 years shows that of 17 treated with irradiation alone, 7 survived 3 years or longer; of 15 treated by chemotherapy, 4 survived 3 years or longer; and, with a combination of irradiation and chemotherapy, 19 of 32 patients survived for this period. All the surviving patients treated by chemotherapy were treated with Myleran, and the results achieved by this drug, particularly in combination with radiotherapy, were as good or better than those achieved by radiotherapy alone.

Adenocarcinoma of Rectum.—At the Department of Radiotherapy at St. Bartholomew's Hospital between 1937 and 1954, 189 patients with adenocarcinoma of the rectum were treated; in 82% the adenocarcinomas were surgically inoperable because of the extent of the disease, and in 18% they were inoperable because of the poor general condition of the patients. The five year survival rate was 5% as compared with the 12 to 15% rate for those undergoing surgery, a figure that includes early cases. The most striking effect of treatment was the relief of symptoms due to the primary growth. This occurred in over 60% of the patients, and in 41% it was not necessary to perform a colostomy.

Intestinal Metaplasia.—At Mount Vernon Hospital, 52 specimens of duodenal ulcer, 28 of gastric ulcer, and 39 of carcinoma, removed at gastrectomy, were examined for the incidence and extent of intestinal metaplasia at the pylorus, lesser curvature, and greater curvature. Areas of intestinal metaplasia were present in 78% of the stomachs examined (in 93% of those removed for carcinoma, in 82% of those removed for gastric ulcer, and in 65% of those removed for duodenal ulcer). Taking the series as a whole, the incidence of intestinal metaplasia at the pylorus was 71%, at the lesser curvature 46%, and at the greater curvature 35%. In the stomachs removed for duodenal ulcer, the pylorus was involved in nearly 60% of cases, whereas the lesser curvature (15%) and the greater curvature (10%) were seldom affected. In gastric ulcer the incidence at the lesser curvature (57%) and at the greater curvature (39%) was relatively higher, and at the pylorus the incidence was 71%. In the stomachs containing carcinoma the incidence of intestinal metaplasia at the pylorus was 87%, at the lesser curvature 79%, and at the greater curvature 67%. As these findings suggested that gastric carcinoma may arise from areas of intestinal metaplasia in the gastric mucosa, a series of 107 primary carcinomas of the stomach were examined. Of these, 35 appeared to arise from an intestinal type of epithelium. This is considered to be a conservative estimate, and it is probable that about half of all gastric carcinomas arise from areas of intestinal metaplasia.

At the same hospital, the Theratron cobalt unit has been used for the treatment of patients since March, 1954. The apparatus has been so designed that the 100-curie source can be rotated in a vertical plane through 360 degrees and can also be moved through an arc normal to the plane of rotation. The authors of the report have been impressed by the fact that it has been possible to deliver presumably adequate doses of a deep-seated lesion without causing severe reactions and without distress to the patient. Despite the advanced nature of many of the lesions that have been treated, primary regression and, in many, complete clinical disappearance has occurred to an extent not previously observed.

Ulcerative Colitis.—At St. Mark's Hospital there are records of 11 patients with cancer following ulcerative colitis, seven cases of which were found by examining colectomy specimens. The specimens made up a consecutive series, unselected in any way, and seven cancers were found in 120 colectomy specimens. The average age of these 120 patients was 42 years. They all had ulcerative colitis and were operated on primarily for this condition, but seven of them were found to be suffering from cancer of the colon. The present position is summarized by saying that any patient in whom severe ulcerative colitis has lasted more than 10 to 15 years has entered a phase of life when intestinal cancer has become a definite risk. The danger of cancer will increase still further with the years. The risk of cancer is not in itself sufficient to justify colectomy in ulcerative colitis if there is no other indication for such radical treatment, but it may sometimes be considered as an additional argument in favor of colectomy in a long-standing case.

Neuroblastoma.—The report from the Hospital for Sick Children, Great Ormond Street, includes a review of the 94 patients with neuroblastoma admitted to the hospital during the past 30 years; 77 presented symptoms during the first 4 years of life, and in one-third of the patients the first manifestation appeared during infancy. In 41 patients the tumors originated in the adrenal and in 24 from the adjacent sympathetic tissue in the abdomen. Metastases had occurred in two-thirds of the children on admission to hospital. Seventy-seven of the 94 patients have died. Death occurred within six months from the onset of symptoms in 75% of these children. The duration of the illness only once exceeded 14 months. In those fatal cases in which therapy was undertaken, no appreciable prolongation of life resulted. In two patients cure appears to have been the result of a spontaneous regression. A follow-up of 20 patients treated by surgery and/or radiotherapy shows that after two to five years 2 of the 5 treated by surgery, 1 of the 11 treated by radiotherapy, and all 4 treated by surgery and radiotherapy are alive. Further details are given of the 17 patients treated with cyanocobalamin. Ten of these children are still alive. The results to date are taken to indicate that vitamin B_{12} has an appreciable effect in nearly 50% of the patients to whom it has been given, although eventual relapse may occur. The therapeutic effects are encouraging in view of the fact that patients were selected for inclusion in this trial only because their disease was not considered amenable to surgery or radiotherapy, most of them already showing evidence of direct or metastatic spread of the neoplastic process by the time treatment was begun. Moreover, several children had been observed for several months before vitamin B_{12} therapy was instituted, with the result that their general condition was poor and some of them died soon after treatment was started. Even when only temporary regression occurred, this has nevertheless been impressive. The standard dose of vitamin B_{12} that is used is 1 mg. on alternate days, and, in patients who respond, this treatment is being maintained over a period of at least two years.

Carcinomas of Bronchus and Breast.—In a series of inoperable cases of carcinoma of the bronchus at Cambridge, it is concluded that intravenous administration of Synkayvite has a small but useful effect as a clinical radiosensitizer in radiotherapy. It appears to be possible to improve the response of some human malignant tumors to radiotherapy by means of chemical radiosensitizers. At Guy's Hospital, 497 patients with fibroadenosis have been followed for variable periods beginning in 1953, and, of these, 18 have developed carcinoma of the breast. Of 181 patients in whom a mass of fibroadenosis has been removed from the breast, 41 have required a further operation. Of 64 patients in whom a mass of adenofibroma of the breast has been removed, 10 have required a further operation. Fifteen patients with carcinoma of the breast that was inoperable when first seen have been able to undergo operation because of irradiation treatment. Seventy-four patients have been treated with large doses of estrogens. With one exception, these were all patients who were postmenopausal and who all had widespread manifestations of the disease in varying sites, both in the skeletal and soft tissue. Of these 74 patients, 7 were unable to take the drug, in 23 there was no response, in 31 there was a moderate response, and in 13 there was an excellent response.

Blood Grouping.—At Whipps Cross Hospital, blood grouping has been investigated in 434 histologically proved cases of malignant disease. The proportions of the various blood groups for malignant disease as a whole do not differ greatly from the controls. If, however, certain types of malignant diseases are placed in arbitrary classes (male genitourinary; female genitourinary; intestinal; respiratory; reticuloendothelial), some variations are seen. Thus, there is a preponderance of group O type blood in male and female patients with genitourinary cancers and of group MN in female patients with genitourinary and reticuloendothelial neoplasms. In female patients with genitourinary cancers, there is an excess of persons who are Rh-positive, and in patients with the four other classes of disease there is an excess of persons who are Rh-negative. The proportion of group B is remarkably constant in all classes. The percentage of blood group substance excretors seems to be raised in male and female patients with genitourinary and respiratory cancers but not in patients with the intestinal or perhaps the reticuloendothelial neoplasms.

Work of the Psychiatric Nurse.—A report on "The Work of the Mental Nurse," published by a joint committee of the Manchester Regional Hospital Board and the University of Manchester, calls attention to the amount of urinary and fecal incontinence in patients in mental hospitals and the apparent absence of attempts at habit training. It is estimated that in nursing time alone each instance of incontinence represents 10 to 20 minutes' extra work. Successful habit training could change the spirit of a ward, as well as saving unnecessary work. Job analysis shows that in most wards there is little requirement for technical nursing of the type required in a general hospital, and it is possible that by reorganization this requirement could be reduced still further. On the other hand, there are many duties specially related to the welfare of the patients, which may be carried out by a qualified nurse, a student nurse, or a nursing assistant according to the staff available in the ward. In general, these duties are well done, but this success is related not to technical qualifications but to the nurse's experience and natural capacity. Thus, psychiatric nursing is now learned largely by doing the job under the supervision of trained personnel and not by formal technical training. It is recommended that the length and content of the training course should be reviewed, with the object of providing courses that are integrally related to the work of mental or mental deficiency hospitals. This does not imply any reduction of standards but may make the course more attractive for those temperamentally suited to psychiatric nursing, because the inter-relation of theory and practice will be more evident and will grow naturally out of the work in the wards. There should be stricter selection of students for training, so that only those will set out on the full course of training who have a reasonable chance of passing. The grade of nursing assistant should be recognized and training for it standardized. The job of a psychiatric nurse involves (1) basic nursing—the care and attention given to the patient in the interests of his comfort and general well-being and the maintenance of his physical health, (2) technical nursing—the nursing tasks concerned with the treatment of the particular illness, mental or physical, from which the patient is suffering, and (3) supervision—the tasks of teaching patients to be socially and morally conscious, establishing rapport between nurse and patients in order to build up personal esteem, observing special precautions to prevent violent outbursts, and keeping patients from escaping. To discharge all these functions effectively the trained nurse must, in addition to technical capacity, be able to show affection and understanding to the patient, train patients of varying ages and mental years to maintain their own personal hygiene, and establish a sense of security in the management of the ward.

Welfare State.—According to the annual report for 1954 of the Ministry of Pensions and National Insurance, at the end of 1954 the Ministry was paying over 900,000 war pensions; family allowances to nearly 3,250,000 families; and under the National Insurance schemes nearly 4,500,000 retirement pensions, about 500,000 widows' benefits and guardians' allowances, and 115,000 industrial disability pensions. In 1954, new claims for sickness benefits totaled more than 7 million, for unemployment over 2,500,000, and for industrial benefits over 80,000. The combined yearly cost of these and other social benefits paid by the Ministry was nearly 2 billion dollars. The standard weekly rates of unemployment benefit, of sickness benefit, and of the retirement pension at the minimum pension age have now risen to $5.60 a week for a single person and to $9.10 for a married couple. Widows' pensions have gone up to $5.60 a week and widows' allowances (for the first 13 weeks of widowhood) to $7.70 a week. The allowance for the first or only dependent child was increased to $1.60 a week and for each other child to 50 cents a week. Maternity grants have gone up to $28, home confinement grants to $11.20, and maternity allowances to $5.60 a week. Industrial injury benefits have risen to $9.45 a week for a single person and $13 for a married couple. Disability pensions are now $9.45 a week for 100% disability.

Salk Vaccine Trials Canceled.—Dr. G. S. Wilson, director of the Public Health Laboratory Service, announced on July 1 that the Medical Research Council had canceled the proposed trials with the Salk poliomyelitis vaccine in England. According to reports of informants in England, it is difficult to insure that every particle of virus in such a vaccine is killed, and it is difficult to see how any vaccine prepared by Salk's method can be guaranteed to be safe. Partly for this reason, and partly for immunologic reasons, many virologists believe that a vaccine containing a living, attenuated virus such as those used against yellow fever in man and against anthrax, hog cholera, and cattle plague in animals offers greater promise of success than a "killed" virus.

Obstetric Research.—To further the work of the existing obstetric research team in Aberdeen the Medical Research Council has agreed, in collaboration with the University of Aberdeen and the North-Eastern Regional Hospital Board, to form a unit for research in obstetrics under the direction of Prof. Dugald Baird. The unit will continue long-term research into problems of maternity, using a combination of epidemiological, clinical, and laboratory methods of investigation.

FINLAND

Respirator Treatment of Poliomyelitis.—In *Nordisk medicin* for July 14, Dr. Ossi Pettay reported that in 1954 there were 615 cases of paralytic poliomyelitis or 15 per 100,000 population. Seventy-four of these needed treatment in respirators. Five different types of respirator, each of which had its special merits and shortcomings, were used. The Emerson rocking-bed respirator proved to be reliable in practice, but because of its height it was difficult to lift very heavy patients into it. Electrically driven devices for aspiration were found to be reliable. All the patients treated in positive pressure respirators underwent early tracheotomy, the merits of which Pettay endorses in spite of the objection that it causes a severe psychic trauma. He found patients to be so alarmed at the prospect of suffocation that they gladly accepted tracheotomy, which was almost always followed by a large dose of scopolamine and morphine. Infections of the

urinary tract were observed in nine patients, and there were two in whom the infection due to Proteus vulgaris proved refractory to treatment. Great difficulties were experienced in restoring the normal functions of the colon. The attacks of tachycardia to which about half the patients were subject did not seem to depend on defective ventilation of the lungs. It may have depended on paralysis of the vagus nerve, and it responded well to treatment with dihydroergotamine.

ISRAEL

Family Health Course.—A new course recently introduced at the Hebrew University-Hadassah Medical School places it in the ranks of those progressive medical institutions tending to lay stress on social and environmental factors in clinical medicine. It is a course in family health, a subject at present taught in only a few universities in the world. This course emphasizes the importance of the family in the study of human disease. It is an outgrowth of the increasing realization that physical illness is often associated with psychological and sociologic factors springing from environmental circumstances. The new course would have been impossible without an appropriate "laboratory," which exists at Hadassah's Community Health Center and aims at promoting the health of the community through methods based on this new approach to medical treatment. The staff consists of physicians, nurses, health educators, psychiatric social workers, a statistician, laboratory worker, psychologist, and an anthropologist. In other words, the health center offers preventive, curative, and rehabilitative services for both physical and psychological disorders but at the same time attempts insofar as possible to eliminate the factors that cause those disorders. That means not only clinical treatment on the premises but also (1) home visits by physicians and nurses who give individual guidance in health and hygiene; (2) efforts to straighten out domestic tangles; and (3) work in community groups by the health educators. The health center was inaugurated two years ago as an experiment, and its apparent success led to the setting up of a similar center at Ashkelon by the local council of the labor fund and the Ministry of Health. Hadassah plans to open two more centers, and the government plans to open four.

The course in family health will be compulsory for all fourth, fifth, and sixth year medical students. In a series of introductory lectures by members of the health center staff, an attempt will be made to integrate the study of pathology with clinical practice as related to individual and family health. The first group of fourth year students has completed this stage, and each student will be assigned a family in the center as his special subject of study until the end of the course. From time to time, groups of 10 students will meet with members of the health center staff to discuss the problems encountered in the studies of their assigned families, and at a certain stage all students will be required to spend a period in residence at the center. Although the new course in family health was recently introduced, facilities for postgraduate training have been available for the past year. Those wishing to specialize in family heal h must be prepared to devote a further five years to it after receiving their medical degree. Most of this time must be spent at a health center.

Cooley's Anemia in Oriental Jews.—In a report in the *Bulletin of the Research Council of Israel* (vol. 4, no. 4, March, 1955) Dreyfuss reported that Cooley's anemia has been observed in members of a Bukharian Jewish family and in Oriental, especially Kurdish, children. Diagnostic criteria for Cooley's anemia were a high erythrocyte count in the presence of a relatively low hemoglobin level (one patient had an erythrocyte count of 6,650,000 per cubic millimeter and 12 grams of hemoglobin per 100 cc.), increased resistance of the erythrocytes to hypertonic salt solutions, and the morphological changes typical of Cooley's anemia. A high incidence of Cooley's anemia was noted by the author in members of three families of Oriental Jews, one from Kurdistan, one from Urfa, and one from Nesibin (Kashmili Jews). The latter two towns are in the southeastern corner of Turkey. At least 17, and possibly 20, of the 32 members of the families examined were found to have the disease. Since the three index cases of these three families were admitted to the hospital because of rheumatic heart disease (a diagnosis proved at autopsy in two of them), a search was carried out for evidences of this disease in the other members of these families. Rheumatic heart disease was diagnosed if clinically and roentgenologically demonstrable lesions were present. Eleven, and possibly 13, of the 32 had rheumatic heart disease. Eight, and possibly 10, had both Cooley's anemia and rheumatic heart disease. The appearance of Cooley's anemia is genetically determined and the susceptibility to rheumatic disease is also considered to be so conditioned, but whether anything more than a chance relation exists between these two conditions in the patients so affected in this series is not known.

New Psychiatric Ward Opened.—Israel's first general hospital department of psychiatry was opened at the Hadassah University Hospital in Jerusalem. The department, which was established by the Hebrew University under the leadership of Prof. Milton Rosenbaum of Cincinnati, started with 10 inpatient beds. Diagnostic and treatment clinics for outpatients will be held twice weekly. The department will provide the core of the clinical teaching of psychiatry to students of the Hadassah Medical School, thus permitting the inclusion of this branch of medicine in the regular undergraduate curriculum as well as serving for the postgraduate training of physicians. Closely associated with the department and integrated into its teaching schedule are the Lasker Child Guidance Center of Hadassah, with its visiting director, Dr. George Mohr, of Chicago, and the Keren Nechuth Mental Hospital, under Prof. H. Winnik. The sum of $150,000 was obtained for the new department as a gift from the Julius and Marie Scheider Foundation in the United States through the good offices of Dr. I. S. Wechsler of New York, a member of the Hebrew University's Board of Governors.

New Clinic Opened.—At a typical Bedouin feast in honor of Mr. Yosef Serlin, Minister of Health, on the occasion of the opening of a two-room clinic in Tel El-Milh, a one hour drive from Beersheba, Sheikh Deeb Salim Abu Rhea said, "The State of Israel has invested millions of pounds in making the desert flourish; it has shown its great interest in easing our hard nomadic life and in making my tribe a settled people." The feast was held in a gigantic black tent that hugged the bleached yellow sands of the Negev. Mr. Serlin answered that making the desert flourish is a blessing to Arab, Jew, and the state.

New School of Dentistry.—A delegation of five dentists paid a two weeks visit to the Hebrew University. All of them were from the United States, where they are active in the drive being conducted in that country by the Alpha Omega fraternity to raise funds for the new Hebrew University School of Dentistry. During their stay in Israel, the delegation advised on the organization of the school and gave lectures and practical demonstrations on dental problems.

World Health Organization Regional Poliomyelitis Laboratory.—The virus laboratory of the Hadassah Medical School will serve as the regional poliomyelitis laboratory of the World Health Organization. The Medical School will receive a one time contribution of $2,000 from the World Health Organization for the purpose of acquiring the necessary equipment.

ITALY

Pathogenesis of Acute Rheumatic Fever.—At a meeting of the Medical and Surgical Society of Verona, Professor Severi said that two main alterations are found in patients with acute rheumatic fever: a fibrin-like degeneration and a marked basophilia made of large cells such as those found in myocardial granulomas. The fact that these alterations can always be found in rheumatic granulomas as a sign of impairment of the precapillary arterioles proves that the agent that causes rheumatic fever very likely attacks the arterial walls. In granulomas in which the muscle alterations are more marked, the newly formed basophils are in close contact with the residue of the altered muscular fibers, and this leads to the assumption that many of these elements should be considered of muscular origin. Their importance is, however, not clear, and it is not clear whether

they should be interpreted as the expression of regenerative attempts on the part of the muscle fibers or as elements that have macrophagic capacity.

The main problem in the pathogenesis of acute rheumatic fever is to establish whether the inflammatory manifestations that are found in rheumatic patients should be ascribed to the direct action of a living agent or to one or more toxic chemical factors, whatever the origin may be. In other words, it is a matter of establishing whether the pathogenesis is chemotoxic or vitalistic. In support of the chemotoxic pathogenesis are many common theories, such as the toxinic, the enzymatic, and the allergic, but they do not give a satisfactory explanation for the mechanism of onset of the inflammations and their continued presence. On the other hand, the vitalistic pathogenesis cannot be accepted because the presence of a living agent in the rheumatic lesions has not as yet been demonstrated. The streptococcic pathogenesis, which appears to be the most probable, cannot be strongly supported because the mechanism by which the streptococci carry out their rheumatic-fever-inducing action has not been defined.

Professor Severi advanced the hypothesis that the streptococci act after undergoing a variation of the L type. The L-type streptococci, or midget streptococci, may originate after the initial streptococcemia that is secondary to the oropharyngeal inflammations, which precede the rheumatic attack. They may originate in the areas in which the normal streptococci that escaped the blocking and destructive action of the reticuloendothelial system survived and nested.

These variants would slowly cause some microgranulomas, which, because of their particular area of development near the vessels or in the walls of the vessels or near the margins of the cardiac valves, would at some time of their growth open up into the blood stream. The rheumatic attack with the entire complex of associated anatomic and clinical manifestations should, therefore, be ascribed to this sudden emission of L-type streptococci into the blood. The difficulty of cultivating the L-type streptococci and their slight or absent sensitivity to the standard antibiotics would explain why in rheumatic patients the cultures are always negative and antibiotic therapy ineffective.

Foods That Do Not Nourish.—Prof. Michele Mitolo of the University of Bari stated in *Notiziario Sanitario* (**13**:1 [Feb. 12] 1955) that some natural foods, when introduced into the organism, cause excessive destruction, elimination, or functional inhibition of essential nutritive principles. They are, therefore, antinutritive foods. The antagonistic activity of sodium and potassium is well known. It occurs also in the case of the multiplication of micro-organisms, which is favored by potassium and blocked by sodium. Calcium inhibits diastole and promotes systole to the point that, in high concentration, it results in the arrest of the heart in an exaggerated systole (calcium rigidity); it acts in a sympathomimetic manner, whereas potassium, its antagonist, acts in a parasympathomimetic manner. Manganese and iron act antagonistically in the development of higher plants so that, when the concentration of manganese increases in the plant, this shows the characteristic signs of iron deficiency (chlorosis), whereas, when the iron increases, manifestations of manganese deficiency can be seen. Amino acids also influence each other, and several pairs that are structurally similar are antagonists. Thus there is antithesis between lysine and arginine and between serine and threonine. Antagonism can also be observed in the case of amino acids that are structurally different. For example, amino acetic acid suppresses the action of serine and alanine. The antagonism between invertin and glucose or fructose is well known, as is also the fact that carbohydrates antagonize the action of vitamin B_1. Rancid fats can oxidize and destroy vitamin A, and an excess of fats decreases the antirachitic activity of a food. There are foods whose excess content of one or more vitamins can induce the deficiency of another vitamin and produce signs of hypovitaminosis or avitaminosis. A gradual diminution of ascorbic acid occurs in the organs of a pigeon in which beriberi has been produced by means of an exclusive rice diet. Sometimes the foods may contain enzymes that split some vitamins; the severe symptoms of muscular paralysis that are observed in animals receiving a diet rich in raw fish are due to the enzyme thiominase, which splits thiamine. The antinutritive elements have a certain selectivity of action. For example, Dicumarol behaves like antivitamin K in animals, whereas it is relatively atoxic for most micro-organisms.

Rheumatology Day.—The third rheumatology day was held in Rome on Feb. 12 and 13. It was organized by the rheumatological center of Rome under the direction of Professor Lucherini, who said that the importance of rheumatology is shown by the interest taken in discovering remedies, such as the recent syntheses of steroids with a marked antirheumatic activity that were derived from biliary acids, and by the preparation of a series of halogenated derivatives of cortisone and hydrocortisone. Professor De Sèze of France said the structural deterioration of an intervertebral disk is characterized by alterations of the nucleus pulposus and the annulus fibrosus that surrounds it. In the so-called preclinical stages, the nucleus pulposus dehydrates and becomes fragmented, while the annulus fibrosus presents at first fragmentation of the laminae and later numerous diastases through which fragments of markedly altered nuclear matter pass and reach the anterior and posterior periphery of the disk. In this phase the production of a classic posterior disk hernia may be observed. This should not, therefore, be considered, as it generally is, an autonomous disease but rather the terminal aspect of a pathological process that evolved in time, with or without marked clinical manifestations. Likewise, lumbar or lumbosacral arthrosis represents the final anatomic phase of the structural deterioration of the disk in vast and advanced forms. Various (professional, static, and dystrophic) etiological and pathogenetic factors can be used to explain the structural deterioration of the disk. The habitus of the patient, especially a state of decreased functional activity, and the mechanical aspects of the structural deterioration of the disk are important. The first phase of the degeneration of the disk is characterized by clinical findings of the so-called painful disk insufficiency; the phase during which a nuclear fragment wedges into the annulus fibrosus is characterized by acute lumbago; and the phase of posterior disk hernia is characterized by sciatica with involvement of the disk and radicle. Treatment should be individualized.

Professor Robecchi of Turin stated that the shoulder-hand syndrome should be classified with the dystrophic syndromes. It should be considered with respect to its proximal and distal localization. The former is a typical scapulohumeral periarthritis; the latter presents at first manifestations of painful swelling of the hand and later of rigidity with multiple trophic alterations. The etiological and pathogenic factors are not yet well defined. In some patients a relationship between the syndrome and a myocardial infarct is present. The treatment of this condition also should be individualized.

NEW ZEALAND

Pituitary Changes in Cryptorchism.—At the 14th meeting of the Otago Medical School Research Society in July, Dr. F. Bielschowsky reported (*Proc. Univ. Otago M. School* **33**:17, 1955) on the alterations found in the pituitary of rats in which cryptorchism had been surgically induced 12 to 18 months earlier. These changes consist of an extraordinary hypertrophy and hyperplasia of those basophilic cells that secrete the luteinizing, or interstitial cell-stimulating, hormone. The individual cells vary greatly in size and stainability. Some resemble normal interstitial cell-stimulating hormone cells closely; others are larger and more heavily granulated than normal and have an enlarged Golgi apparatus. Exhausted cells with pyknotic nuclei and vacuolated cells are also present. In cryptorchism the diffuse hyperplasia of interstitial cell-stimulating hormone cells, which is also seen in rats with diethylstilbestrol implants, can assume in certain zones a nodular or even adenomatous character. These observations, in conjunction with the fact that so far in four rats with cryptorchism benign tumors of the breast have developed, suggest that an estrogen secreted by the ectopic testes may be a factor in the pathogenesis of the pituitary changes described.

CORRESPONDENCE

SIMPLE TEST FOR DIAGNOSIS OF METASTATIC CARCINOID (ARGENTAFFINOMA)

To the Editor:—An unusual syndrome has been described recently in association with malignant carcinoid of the small intestine and hepatic metastases (Isler, P., and Hedinger, C.: Metastasierendes Dünndarmcarcinoid mit scheren, vorwiegend das rechte Herz betreffenden Klappenfehlern und Pulmonalstenose—ein eigenartiger Symptomenkomplex? *Schweiz. med. Wchnschr.* **83:**4-7 [Jan.] 1953). This syndrome is principally manifested by peculiar cutaneous flushes, chronic diarrhea, respiratory distress, and valvular disease of the heart. Personal experience with five cases of this syndrome within the past few months and the knowledge of several other such cases makes it likely that there are many more such cases as yet undiagnosed. Because of protean clinical manifestations, the "carcinoid syndrome" may mimic a variety of diseases. The cutaneous flushes are characterized by episodic erythema, patchy cyanosis, and blanching and may be confused with other types of vasomotor instability. They were erroneously ascribed to the menopause in one of our patients. A persistent cyanotic appearance may be noted in the absence of decreased arterial oxygen saturation. The intestinal hypermotility simulates that seen in other conditions including dysentery, sprue, and functional gastrointestinal disorders. A prolonged clinical course aids in distinguishing malignant carcinoid from other malignant intestinal lesions. Paroxysmal dyspnea and wheezing are sufficiently prominent in some of the patients to cause confusion with other conditions causing bronchospasm. Valvular disease of the heart, usually pulmonic stenosis and tricuspid regurgitation, is apparently a late development. The hepatomegaly may lead to confusion of this syndrome with primary hepatic disease and, in the presence of valvular heart disease, may be falsely attributed to congestive failure. Thorsen and his co-workers (Malignant Carcinoid of the Small Intestine With Metastases to the Liver, Valvular Disease of the Right Side of the Heart [Pulmonary Stenosis and Tricuspid Regurgitation Without Septal Defects], Peripheral Vasomotor Symptoms, Bronchoconstriction, and an Unusual Type of Cyanosis: A Clinical and Pathologic Syndrome, *Am. Heart J.* **47:**795-817 [June] 1954) suggested that carcinoid tumors might secrete large amounts of 5-hydroxytryptamine (serotonin) that conceivably could induce the manifestations of the syndrome. Using methods developed in our laboratory hyperserotonemia and an elevated urinary excretion of a serotonin metabolite, 5-hydroxyindoleacetic acid (5HIAA), have been demonstrated in patients with this syndrome. The normal 24-hour excretion of 5-HIAA is 2 to 8 mg. In five patients with the carcinoid syndrome, it was 140 to 628 mg. Measurements of urinary 5-HIAA in a variety of clinical conditions indicate that an increased excretion of 5-HIAA is specifically associated with metastatic carcinoid. Because of the large excretion of 5-HIAA in these patients, a direct color assay for this substance can be employed on a small aliquot of urine. This simple test is an adaptation of the quantitative assay and is based on the development of a purple color, specific for 5-hydroxy-indoles, on the addition of 1-nitroso-2-naphthol and nitrous acid.

The reagents are: 1-nitroso-2-naphthol (0.1% in 95% ethanol); nitrous acid (prepare fresh by adding 0.2 ml. of 2.5% sodium nitrite to 5 ml. of 2 *N* sulfuric acid); and ethylene dichloride. The following methods are used: run a normal urine for comparison; pipette into a test tube: 0.2 ml. of urine, 0.8 ml. of water, 0.5 ml. of 1-nitroso-2-naphthol and mix. Add 0.5 ml. of nitrous acid; and mix again. Let stand at room temperature for 10 minutes, then shake with 5 ml. of ethylene dichloride. If turbidity results the tube should be centrifuged. A positive test is indicated by a purple color in the top layer. No purple color will be seen with normal urine, though a slight yellow may be noticed. Assuming an average 24-hour urine volume of 1,000 ml., a purple color will be seen at levels of 5-HIAA excretion as low as 40 mg. per 24 hours. At higher levels the color is more intense and is almost black at levels above 300 mg. per 24 hours. Another substance, *p*-hydroxyacetanilid, reacts similarly but is found in urine only after administration of acetanilid or related drugs. The color formation may be inhibited in conditions resulting in the excretion of huge amounts of keto acids.

Our experience with five cases of the carcinoid syndrome suggests that an elevated urinary excretion of a serotonin metabolite, 5-hydroxyindoleacetic acid, is a constant feature of this condition. The limits of the chemical diagnostic test can only be defined by a study of many such cases. Large amounts of 5-hydroxytryptamine or serotonin have been found (Lembeck, F.: 5-Hydroxytryptamine in a Carcinoid Tumour, Nature, **172:** 910-911 [Nov. 14] 1953. Ratzenhofer, M. and Lembeck, F. Über den Gehalt an 5-Oxytryptamin in Carcinoiden des Darmtraktes, *Ztschr. Krebsforsch.* **60:**169-195, 1954) in solitary and metastatic carcinoid tumors, but it is still not known whether all carcinoid tumors produce 5-hydroxyindoles and secrete excess amounts into the blood. If carcinoid tumor is suspected clinically and the qualitative urine test is negative, a quantitative assay should be performed to detect abnormalities of 5-hydroxyindoleacetic acid excretion not revealed by the simple method.

POISONING

To the Editor:—In THE JOURNAL, May 28, 1955, page 335, in an otherwise scholarly and commendable article ("The Gentle Art of Poisoning") the following assertion is made: "An unmilitary race, the Jews, furnished the largest number of those who devoted their talents to this hand maiden of death." This assertion is, however, not supported by historical documentation. As a Hebrew scholar and historian of medicine, I am compelled to assure the readers of THE JOURNAL that no facts are known that might lend support to this view. The epical parts of the Bible often refer to elimination of enemies by assassination, but the "gentle art of poisoning" does not play a role in Biblical reports. In the Middle Ages, during the epidemic of the Black Death, an accusation was raised that the Jews had poisoned the wells. As a consequence many thousands of Jews were slaughtered. Historical research repeatedly revealed the unfoundedness of this accusation. During the Middle Ages many kings, popes, and princes preferred Jewish physicians. Apart from the consideration of professional skill, this preference was based on the conviction of these dignitaries that Jews would not dare to poison them by so-called medical procedures, since they would thereby bring down disaster upon their co-religionists. A Hebrew medical manuscript of the 13th century "Sefer Hayosher" (Book of Righteousness) urges Jewish physicians to excel in the careful medical treatment of gentiles (Friedenwald, H.: Jews and Medicine, Baltimore, Johns Hopkins Press, 1944, pp. 560, 661).

Finally I wish to comment on the second column of the paper, where the second paragraph refers to Hebrew literature. The drug dudaim (misprinted sudaim) in Genesis 30:14, is indeed Mandragora and was used as an aphrodisiac. The "bitter waters," Numbers 5:18, was used as an ordeal on mystic and not on toxicologic grounds. As to witches there is a general reference to them in Exodus 22:17 without any connection with the art of poisoning.

ADVICE PRIOR TO MARRIAGE

To the Editor:—As an obstetrician and a gynecologist, I have a growing interest in better preparation for marriage among young people. Those of us who have long been in practice know of the number of couples who, finding their marriages going on the rocks, come to their doctors for help. If our young people had better instruction on the "facts of life" before they married, we would have fewer problems in marriage. The physician seldom has the two or three hours necessary to counsel premarital couples even if he were skilled in all phases of marriage. The Planned Parenthood Federation of America is one of the few agencies to which a physician can refer his premarital patients for broader education for marriage. Most of the larger cities have a program of education for marriage in conjunction with other Planned Parenthood services. For their addresses, one may write the Planned Parenthood Federation at 501 Madison Ave., New York 22, N. Y. The Roman Catholic church provides its young people with information in its pre-cana conferences. I am familiar with the course conducted by the Planned Parenthood Association in Chicago, at 203 N. Wabash Ave. A four-session course held weekly each month provides engaged and newly-wed couples with salient facts about marriage. Each two-hour session has a leader who discusses the physical, emotional, and spiritual aspects of marriage, as well as interpersonal relationships and money-management. In these sessions there is much give and take. Before the course is finished many questions have been answered and fears allayed. Patients are referred back to their physicians because one of the important features of the Planned Parenthood Association is not to interfere with the physician-patient relationship. The Planned Parenthood groups know they can not do the whole job. They encourage candidates for marriage to have complete physical examinations by their own physicians. They emphasize that the girls getting married should have a careful pelvic examination. Young people often feel that if they have the blood test required by law, that is all that is needed. Planned Parenthood encourages young people to seek the knowledge and understanding that lead to harmonious marriage. Unfortunately, physicians have neither the time nor the knowledge to cover all aspects of marriage. Education for marriage is a comparatively new service offered by Planned Parenthood Associations, and many physicians may not know of its existence. I should like to recommend that they inform prospective brides and grooms that this essential course is available.

THE CADUCEUS

To the Editor:—The introduction of the caduceus as the insignia of the Medical Corps of the U. S. Army is not an error as stated by Dr. James E. Cottrell (*J. A. M. A.* **158:**1308 [Aug. 6] 1955). In a paper entitled "Medical Symbols and Medical Saints" published in Merck Report July, 1949, I stated that the most satisfactory explanation of how the staff of Mercury with its two wings and two serpents was ultimately chosen as the official insignia of the Medical Corps of the U. S. Army is contained in an article that appeared in the *Classical Journal* (vol. 25, 1929-1930) and which states that in 1909 the caduceus was introduced by Col. John R. van Hoff as a result of extensive studies of Babylonian mythology. Colonel Fielding H. Garrison, the well-known medical historian, became van Hoff's chief supporter in the use of the caduceus, especially after the publication of studies on the subject made by A. L. Frothingham in 1916, the results of which were fully set forth at that time in the *American Journal of Archeology*. Frothingham shows that the Greek god, Hermes, was an assimilation of the old Babylonian snake god, the awakener of life and vegetation and the master of the healing art. Hermes was the first to be represented with the caduceus, the first example of which is to be seen on a libation vase of about 3,500 B. C. found at Lagash in Mesopotamia. The snake god, messenger of the supreme goddess, Ishtar, also was the god of the treaties and their sanctity after wars and the god of the envoys designated as such by the caduceus, bringing peace and armistice messages to the fighting armies. They were protected against all harm by this insignia of their neutrality. Thus Colonel van Hoff suggested the use of the caduceus as the official symbol of the Medical Corps to stress the noncombatant status of that branch of the Army.

DISPOSAL OF DRUG SAMPLES

To the Editor:—In The Journal, June 4, 1955, page 424, in the Correspondence section are letters concerning discarding of drug samples. I have found the Society of St. Vincent de Paul to be my salvation. This society will call for and take clothing, furniture, books, magazines, and even bedding. These things are used for such purposes as family relief, vacation equipment for poor children, Christian burial of unclaimed bodies of Catholic faith, care of seamen, visitation of sick in hospitals, and juvenile crime prevention. For some years I have collected samples of drugs and kept them in a carton that, when filled, is picked up by the society. I notify this agency either by telephone or postcard, the latter incidentally being supplied by the society. Apparently some of this material is used in behalf of a hospital that the society conducts. It contains 250 beds and is for children, many of them foundlings. Some children are adopted; the remainder are kept indefinitely. The hospital, St. Vincent's, sorts out that which can be used and burns or disposes of the remainder. I refer to my own experience simply with the thought that other doctors may find similar institutions in their own locations that may be able to use the samples and other material not desired by the physician.

RETIREMENT FOR DOCTORS

To the Editor:—Several months ago, I proposed a plan for retiring doctors that was published in the Correspondence section of The Journal (**158:**216 [May 21] 1955). The response from many doctors was very encouraging. Some have suggested that the American Medical Association should undertake to promote it. I am informed that it is against the principles of the American Medical Association to assume financial responsibilities for such enterprise. Therefore, it will have to be promoted by the doctors themselves as a private organization. I realize that this is a great undertaking with many responsibilities and will require the help of many men. If all those interested in furthering the project would be kind enough to send me their names and addresses, and if possible, their willingness to take an active interest, we could then arrange a time and place for a meeting, elect officers, and formulate plans for its development.

Oak Park, Ill.

CHLORPROMAZINE DERMATITIS

To the Editor:—Considerable amounts of chlorpromazine are used in this hospital, and there has been one severe case of dermatitis in a nurse who handled this material. Treatment was instituted after the allergy first became apparent, and she returned to work using the recommended precautions of gloves and other routine care. Even this exposure was too much for her, however, and she developed a generalized dermatitis requiring hospitalization and two months' loss of work after being exposed only to the fumes from broken vials of this material. We are now following the practice of relieving any nurse or any attendant following the slightest allergy to this material completely from all further contact.

MEDICAL LITERATURE ABSTRACTS

INTERNAL MEDICINE

Rheumatic Fever Activity Determination by Two Correlative Methods. R. K. Skillman, W. Spurrier, I. A. Friedman and S. O. Schwartz. A. M. A. Arch. Int. Med. **96:**51-60 (July) 1955 [Chicago].

Skillman and associates show that the principle of the antigen-antibody reaction has been the basis for numerous tests to identify infectious diseases. It has also been shown that erythrocytes that have been coated with an antigen are agglutinated when antiserum prepared from this coating antigen is added. When complement is added to this system, under certain conditions, hemolysis occurs. Because rheumatic fever is associated with tissue reaction to group A beta-hemolytic streptococci, the studies described aimed to determine whether a means of identifying a specific bacterial antigen, or antibodies elicited by it, could be the means of ascertaining rheumatic fever activity. Two methods of determination were employed. In one method, serum of rheumatic fever patients was used as the antibody source; sheep red blood cells, coated with heat-killed group A beta-hemolytic streptococci, which had been isolated from active rheumatic fever patients, were used as the antigen source; complement was added to produce hemolysis. The other method utilized group A beta-hemolytic streptococci antiserum obtained from rabbits as the antibody source; erythrocytes of rheumatic fever patients, exposed to the antigen for coating in vivo, were used in an agglutination test as the antigen source. In most instances the hemolysis method, using patients' serum as the antigen source, was found to be somewhat more sensitive; in both methods, treating erythrocytes with papain was found to enhance the reaction. Control studies of 77 varied patients, including those from whom alpha-hemolytic and beta-hemolytic streptococci were isolated, showed no instances in which other disease processes interfered with either test method. This would indicate an excellent specificity of these tests in active rheumatic fever. Clinical correlations were obtained for 78 rheumatic fever patients, most of whom were tested at intervals of the disease process. The titers in both test methods were elevated within the first few days of the active process in most cases, and they then gradually subsided and disappeared as the process became inactive. The results also indicated an excellent correlation between the test results and the clinical status of the disease, although the height of the titer was not indicative of the severity of the process. The authors conclude that these methods are of practical value in ascertaining activity or quiescence of a rheumatic fever process, as well as in distinguishing rheumatic fever from other disease processes.

Pulmonary Embolism: A Review with Emphasis on Clinical and Electrocardiographic Diagnosis. S. Krause and M. Silverblatt. A. M. A. Arch. Int. Med. **96:**19-25 (July) 1955 [Chicago].

The autopsy incidence of pulmonary embolism is much higher than that anticipated by clinical diagnosis. The authors reviewed the cases of pulmonary embolism that occurred at Montefiore Hospital during the past five years. Of 67 records examined, the authors selected 62, because in 5 the data were inadequate. Autopsies were performed in 33 of the cases. Twenty-nine patients recovered. There were 49 medical cases and 13 surgical. Of the 33 autopsied cases (25 medical and 8 surgical), only 9 were correctly diagnosed before death. With regard to the pathological aspects, the authors differentiate two types of pulmonary embolism: (1) massive, fatal pulmonary embolism without pulmonary infarction and (2) pulmonary embolism with pulmonary infarction. In fatal pulmonary embolism without pulmonary infarction, the main stem of the pulmonary artery and the larger branches are blocked by a clot that is twisted, cylindrical or thickened, fragmented or intact, and varying in length from 15 to 30 cm. The cylindrical clots originate in the femoral and external iliac veins. Because death is usually sudden, there is inadequate time for pulmonary infarction and secondary pathological changes to develop. The lungs are only slightly edematous and hyperemic. The right ventricle is usually dilated. Infarction of the lung secondary to pulmonary embolism was observed in 24 of the 33 autopsied patients. Usually the infarct is pyramidal or wedge-shaped, with its base directed pleurally and its apex at the site of vascular occlusion. The very fresh infarctions are not so sharply defined. During the first few days, the infarct is pink and soft. Later the infarcted area becomes progressively firm and dark until organization is completed. A region of fibrinous pleuritis, resulting in fibrous pleural adhesions, often marks the site of a previous pulmonary infarction. Many infarcts apparently disappear, but, if the lung is carefully inflated and diligent search made, small peripheral scars often indicate the site of the old pulmonary infarction. The incidence of signs and symptoms of pulmonary embolism are recorded as follows: apprehension and related mental symptoms were observed in 60, pulmonary infarction in 58, peripheral circulatory collapse in 50, and failure of the right side of the heart in 45 patients. The authors feel that a high index of suspicion is the first prerequisite for diagnosing pulmonary embolism. Physicians should be especially aware of the frequency of pulmonary embolism as a complication of congestive heart failure. Apprehension, anxiety, and their concomitants should be considered "premonitory" symptoms of pulmonary embolism. These warning signs, often confirmed by early electrocardiographic studies, should lead to vigorous prophylactic treatment. The electrocardiogram may be diagnostic or suggestive of pulmonary embolism when physical signs are absent. The authors feel that in the future, with improved techniques, it may often become possible to remove an obstructing embolism from the main pulmonary artery.

The Effect of Corticotropin and Cortisone on Respiratory Function in Bronchial Asthma. T. W. Fyles, J. A. P. Pare and B. Rose. J. Allergy **26:**340-358 (July) 1955 [St. Louis].

Eight patients with bronchial asthma were selected at random and were hospitalized for two weeks at the beginning of the study. A complete medical and allergic work-up was done, including skin tests, hemogram, roentgenograms of the chest and sinuses, excretion of urinary steroids, and pulmonary function tests. After a control period during which treatment was limited to providing symptomatic relief, treatment with corticotropin was started. The patients were then discharged and treated with cortisone given orally, returning at frequent intervals for repeat pulmonary function tests. The pulmonary function tests included vital capacity and its subdivisions, maximum breathing capacity, residual volume, and the index of intrapulmonary mixing. Duplicate determinations of the functional residual volume were made and results were not accepted if there was a difference in excess of 3% of the mean values. These results were compared with predicted normal values for each patient. The degree of improvement seen in the pulmonary function of the eight patients was variable but striking; four patients showed normal pulmonary function at the end of the study; three were normal with the exception of an elevated residual volume; and one showed no change. In three patients in whom the residual volume remained elevated, symptoms of asthma were only in-

The place of publication of the periodicals appears in brackets preceding each abstract.

Periodicals on file in the Library of the American Medical Association may be borrowed by members of the Association or its student organization and by individuals in continental United States or Canada who subscribe to its scientific periodicals. Requests for periodicals should be addressed "Library, American Medical Association." Periodical files cover 1946 to date only, and no photoduplication services are available. No charge is made to members, but the fee for others is 15 cents in stamps for each item. Only three periodicals may be borrowed at one time, and they must not be kept longer than five days. Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

completely relieved. It was found that there was a rapid improvement in the vital capacity, maximum breathing capacity, and index of intrapulmonary mixing with treatment, but the residual volume required somewhat longer periods of therapy to return to normal. It is believed that the changes in pulmonary function found in bronchial asthma are due to hyperinflation of the lungs occasioned by the bronchospasm encountered in this disease and that, with treatment sufficient to completely remove the bronchospasm, these changes are reversible.

Regressive Gigantic Bullous Pulmonary Emphysema in Tuberculosis of Adults. D. G. Alarcón. Gac. méd. México **85:**73-86 (Jan.-Feb.) 1955 (In Spanish) [Mexico, D. F., Mexico].

Formation of gigantic pulmonary air bullae complicating isoniazid therapy, alone or in association with streptomycin and *p*-aminosalicylic acid, may develop in patients with severe forms of pulmonary tuberculosis, frequently bilateral. This complication has the following characteristics. A rapid clinical favorable response and radical clearing of the exudative and caseous pulmonary lesions observed in the roentgenogram follow the treatment. The cavities and potential pulmonary tuberculous lesions that show as dark spots in roentgenograms taken before the treatment are substituted in posttreatment roentgenograms by gigantic and small air bullae respectively. The bullae are delimited from one another by an extremely fine wall. They grow in large numbers and in groups during the stage of total removal of intracavitary material by isoniazid. Later, they diminish in size and many of them disappear. The air passes freely from the bronchi into the bullae. It can be observed in resected specimens of the lung involved by this complication that cavities turned into air bullae are deprived of intracavitary epithelium, which is replaced by a fine layer of connective cells. The pleural space is occluded. A man with a roentgen diagnosis of a severe form of pulmonary tuberculosis with cavitation was given four doses of Friedmann's vaccine and a total dose of 15 gm. of isoniazid, which was taken at irregular intervals for a period of time not precisely stated. A marked temporary improvement was followed by aggravation, during which a large number of air bullae were seen in the roentgenogram. The treatment consisted of streptomycin, isoniazid, and *p*-aminosalicylic acid in daily doses of 1 gm., 300 mg., and 12 gm., respectively, for the period of regression of the air bullae, about three months, in association with vasodilating drugs. After regression of air bullae, the doses of the drugs were diminished and given at longer intervals until clinical and bacteriological cure of the patient was effected. The author believes that formation of air bullae in the lung depends on several combined factors: (1) destruction of an area of the alveolar parenchyma, even if minimal; (2) free passage of air from the bronchi into the cavity or potential lesion by suction of the involved parenchymal area due to diminished expansion of the lung; and (3) perilesional and bronchial vascular spasm elicited by a sympatheticotonic action of isoniazid. Restoration of bronchial and pulmonary circulation favors regression of the air bullae. Prevention consists in giving isoniazid after a preliminary course of treatment with streptomycin and *p*-aminosalicylic acid and in administering vasodilating drugs in the course of isoniazid therapy. In the case reported by the author, the Friedmann's vaccine seems to have elicited a multiple focal necrotic reaction of pulmonary tuberculous tissues that potentiated the local ischemic action of isoniazid with consequent formation of the bullae.

The Diagnosis of Esophageal Carcinoma by Exfoliative Cytology, Including Two Cases of Cardiospasm Associated with Carcinoma of the Esophagus. M. I. Klayman. Ann. Int. Med. **43:**33-44 (July) 1955 [Lancaster, Pa.].

Forty patients in whom pathological lesions of the esophagus were suspected underwent cytological examination by lavage with isotonic solution of three chlorides (Ringer's solution) using a Levin tube. Of the 40 patients, 20 had malignant growths, proved histologically in 18 and by surgical exploration in 2. According to roentgenologic findings, 13 of the 20 patients had malignant lesions, in 4 the roentgen diagnosis was doubtful, and in the remaining 3 the roentgen diagnosis was that of a nonmalignant growth. Esophagoscopic examination revealed malignant lesions in 15 of the 20 patients, and biopsy indicated malignant lesions in 12. In 19 of the 20 patients a correct diagnosis of malignancy was made with the aid of cytological examination using Rubin's modification of the Papanicolaou staining procedure. There were no false-positive cytological reports. It would appear from these observations that exfoliative cytology can detect carcinoma of the esophagus accurately and in cases in which radiology and esophagoscopy fail. Case summaries are presented of three of the patients with esophageal carcinoma that demonstrate clearly the contribution of exfoliative cytology in detecting unsuspected malignancy of the esophagus. Two of these three patients, a 55-year-old woman and a 68-year-old man, both of whom had cardiospasm, were treated for years by dilatations. In the case of the woman, the clinical course did not conform with that of most patients with esophageal carcinoma, and exfoliative cytology was the only diagnostic method that identified the malignancy. Although malignancy was suspected clinically in the man, the first objective evidence of its presence was gained by cytology. Exfoliative cytology in addition to radiographic and esophagoscopic examinations for the detection of malignancy should be performed annually and with each exacerbation of symptoms in patients with cardiospasm. The third patient, a 69-year-old man, presented the problem of differential diagnosis of jaundice. In view of the absence of esophageal symptoms and negative roentgenograms, a bile duct carcinoma was considered most likely. It is noteworthy that malignant cells were recovered from an unanticipated carcinoma of the esophagus. Although the patient was asymptomatic, metastases to the mediastinal nodes had developed. Benign lesions of the esophagus were found in 20 of the 40 patients, and all were correctly reported on the basis of cytological examinations.

Partial Eventration of the Right Diaphragm (Congenital Diaphragmatic Herniation of the Liver). A. Vogl and A. Small. Ann. Int. Med. **43:**61-82 (July) 1955 [Lancaster, Pa.].

The occurrence of partial eventration of the right diaphragm with herniation of the liver is reported in three men between the ages of 62 and 78 and in three women between the ages of 49 and 63. In five of the six patients the more common type of partial eventration was observed with involvement of the anteromedian part of the right diaphragm. The following characteristic radiological features were found in these five patients. On fluoroscopy a semicircular or semioval, homogeneous, nonpulsating shadow of soft tissue density was seen in the right lung field, arising from the median portion of the diaphragm with a broad base or pedicle. It was situated close to the right cardiac border and filled the cardiophrenic angle. It became more prominent on deep inspiration when the lateral and dorsal portions of the diaphragm moved downward, while the convex segment either remained at the same level or perhaps even moved upward (paradoxical motion). The mass varied in size from that of an orange to that of a grapefruit. Radiographic studies demonstrated the location of the mass, its homogeneous nature, the sharp, convex, occasionally slightly scalloped outlines, and its continuity with the liver shadow. The sixth patient had the less common form of partial eventration in which the central portion of the right diaphragm is involved. The radiological findings were the same as in the other five patients except for the location of the masses atop the dome of the hemidiaphragm. These observations are virtually diagnostic of partial eventration of the right diaphragm with herniation of liver into the diaphragmatic pouch ("superior accessory lobe" of the liver). If unequivocal confirmation of this diagnosis is desired, it may be obtained by intraperitoneal insufflation of 250 to 1,000 cc. of air, which produces separation of the diaphragm and the liver by a translucent zone of gas. Although artificial pneumoperitoneum was carried out in four of the authors' patients, it must not be considered a routine diagnostic procedure for this type of condition, since simple fluoroscopic and radiographic examination will permit a reasonably certain diagnosis in most cases. Partial eventration of the right diaphragm was observed by other workers in adults and in children. The authors' observations corroborated the impression of others that, as a rule, the condition is an incidental finding, entirely innocuous and not the cause of symptoms. It is therefore almost invariably

V 1
195

detected during a routine examination or in the course of investigations of symptoms caused by some other disease, such as ovarian carcinoma with widespread metastases or chronic duodenal ulcer in two of the authors' patients. Aplasia of the diaphragmatic muscle in an area derived from the embryonic septum transversum is offered as a possible explanation for the more common type of hernia of the right diaphragm that is known to exist at birth and is found regularly at the same location. The term congenital diaphragmatic herniation of the liver is suggested as most appropriate for the condition.

Medical Treatment and Prognosis of Ulcerative Colitis. A. Fieschi and F. Cuneo. Minerva med. **46:**1171-1174 (April 25) 1955 (In Italian) [Turin, Italy].

The causative factor of ulcerative colitis is still unknown, and attempts to reproduce the condition experimentally have failed. Its frequent association during the last years with allergic states and the prompt, though transitory, response to cortisone and corticotropin therapy seem to support the theory of its being a phenomenon of local hypersensitivity of the Schwartzmann type. Because of its unknown etiology, treatment has to be symptomatic and individualized. General treatment includes blood transfusions, which in some instances are extremely useful, and the administration of liver extracts, liver-protecting preparations, amino acids, insulin, and multiple-vitamin preparations. Complete rest in bed and hospitalization are necessary during the acute phase of the disease, and in severe cases the diet should be integrated with the intravenous administration of amino acids and sugars. Antibiotics and sulfonamides should be used with caution, in order not to modify too markedly the normal bacterial flora of the intestine. The therapy should be discontinued only if a true improvement in the number and character of movements and in the general condition is observed. Oral administration of antibiotics may cause severe damage, such as manifestations of hemorrhagic enteritis, and the eventual formation of resistant strains. Clinical improvement has been obtained with cortisone and corticotropin, but it was not accompanied by adequate anatomic modifications, and in most instances the remission was partial and transitory only. In severe cases the administration of corticotropin may cause peritonitis owing to intestinal perforation. Better results have been obtained with sulfonamides. Recently salicylazosulfapyridine (Azulfidine) has proved greatly beneficial in average doses of 1 gm. given orally four to six times daily. In many cases, psychotherapy can be extremely useful, although it has never resulted in complete recovery. Prognosis of the medical treatment of ulcerative colitis depends on the remissions that are obtained. In general, the results are not too encouraging and no particular drug has proved especially beneficial. If a remission is followed by repeated acute and severe relapses, the prognosis is poor, medical treatment should be discontinued, and surgery should be resorted to.

Use of Fructose in Diet and Treatment of Patients with Diabetes Mellitus. R. Klinger and P. Dalle Coste. Minerva med. **46:**1389-1392 (May 16) 1955 (In Italian) [Turin, Italy].

The utilization of fructose by patients with diabetes mellitus was studied by (1) administering both fructose and glucose to a group of patients and comparing the blood sugar levels and the urine values of the two substances; (2) adding a certain quantity of fructose to the diet of the patients and administering insulin in fixed doses; (3) substituting carbohydrates of the standard diet with fructose; and (4) resubstituting the fructose, after several days of administration, with carbohydrates. The results indicated that fructose is utilized very rapidly by the patients even after a prolonged administration of large doses of it. However, it is utilized by these patients at a much slower rate than it generally is by healthy persons. It is useful in large amounts if it is given in divided doses in addition to, or as a substitute for, other carbohydrates. It results in weight gain, decrease of the patient's need for insulin, and improvement in his general metabolic condition. Its administration can be a true therapy for patients with conditions secondary to diabetes mellitus (acidosis and renal and myocardial impairment) as well as for those with intercurrent diseases, when diet and drugs are not beneficial. In such instances the intravenous route of administration can be used, because large quantities of sugar can thus be given, provided the rate of administration is checked to avoid reaching the renal threshold too quickly. The results of this series of studies indicated that fructose, which is easy to administer and definitely devoid of dangers, is useful for patients with diabetes mellitus.

Comparative Life Expectancy of Hypertensive Patients with Surgical and Conservative Therapy. K. G. Pfeffer, H. Nieth and H. Schneider. Deutsche med. Wchnschr. **80:**956-958 (June 24) 1955 (In German) [Stuttgart, Germany].

The authors compared the length of survival five or more years after operation in 206 hypertensive patients who underwent sympathectomy with that in 306 patients who received conservative treatment, that is, a diet with a restricted salt content, sedatives, and blood-pressure–reducing drugs. As regards the severity of hypertension the following groups were differentiated. Those of group 1a had relatively slight increases in the systolic and diastolic pressures, the eyeground changes were slight, there were no cerebral changes, and the renal function was normal. In those of group 1b the systolic and, particularly, the diastolic pressure showed a more pronounced increase, and there were circulatory disturbances particularly in the eyegrounds and in the brain. Group 2a included the hypotensive patients with arteriosclerotic changes (sclerosis of the central arterial system, with apoplexy, coronary sclerosis, and aortic sclerosis). Group 2b included those with malignant hypertension with or without renal impairment and with progressive functional and organic changes in the arterial system. The late phases of malignant hypertension with renal insufficiency were classified as group 2c. The results of sympathectomy were especially favorable in the early forms of so-called malignant hypertension (group 1b), that is, of 39 who were subjected to sympathectomy, 36 were still alive after five years, whereas, of 56 patients with this form of hypertension who received conservative therapy, only 32 were alive after that period. Similar differences were observed in the more advanced forms of malignant hypertension (group 2b). More than a third of those treated surgically but only about a sixth of those treated with conservative measures survived more than five years. Surgery did not, however, improve the life expectancy of patients with the late forms of malignant hypertension. Sympathectomy produced no improvement in the patients with advanced sclerosis of the vessels. Uremia was the cause of death less often in those who had undergone sympathectomy than in those who had received conservative measures.

Essential Hyperlipaemia. R. A. Joske. M. J. Australia **1:**826-831 (June 4) 1955 [Sydney, Australia].

Joske reviews the literature on essential hyperlipemia and presents the clinical features of seven additional patients, one man and six women, whose ages ranged from 30 to 63 years. Five patients had a family history of cardiac disease and one of cholelithiasis. Skin nodules were present in four patients and tendon nodules in one. Four patients had hepatomegaly and one splenomegaly, while five had pancreatitis and two had cholelithiasis. Vascular disease was present in two patients, one of whom developed status anginosus. One patient had probable pituitary lesions and mild diabetes mellitus. All patients had persistent hyperlipemia, although its degree varied greatly. Four patients also had hypercholesteremia. Treatment by a diet of low-fat content did not invariably reduce the blood lipid content. A prolonged course of heparin treatment in one patient with status anginosus affected neither the clinical nor the biochemical findings. Essential hyperlipemia is considered to be a genetically determined anomaly of metabolism, manifested by a family history of vascular disease, pancreaticobiliary disease or diabetes mellitus. The clinical symptoms include xanthomas of skin or tendons, particularly xanthelasma; variable hepatosplenomegaly; pancreatitis; cholelithiasis; atherosclerosis; and diabetes mellitus. Biochemical investigation shows persistent hyperlipemia due to an increase of neutral fats and sometimes of cholesterol and phospholipids. Treatment at present is dietetic and symptomatic, but its efficacy is not certain.

Leptospirosis in Israel: Clinical Forms and Problems of Treatment. K. Marberg. Harefuah **48:**235-240 (June 1) 1955 (In Hebrew, English Abstract,) [Jerusalem-Tel Aviv, Israel].

A study of 196 cases of leptospirosis observed in Israel during the last five years gave the following results: 95% of the cases were caused by Leptospira grippotyphosa and 5% by Lept. canicola. Jaundice appeared in 70% of all cases. This contrasts with the anicteric course of leptospirosis due to Lept. grippotyphosa in Europe. The local disease is therefore more similar to classical Weil's disease. Icterus was present in 45% of the small group of Lept. canicola cases. Renal symptoms were found in 50% of the cases and in one-third the full hepatorenal syndrome appeared. Only a few meningeal cases were observed, among them three cases of primary aseptic meningitis. The disease was not very severe. The single fatal case was due to Lept. canicola. Antibiotic therapy with penicillin, aureomycin, and terramycin did not give clear-cut results, although in certain severe cases terramycin appeared to shorten the febrile period. Patients with severe hepatorenal disturbances require therapy of lower nephron nephrosis.

Case of Favism. N. A. Bolt. Nederl. tijdschr. geneesk. **99:**1651-1655 (June 4) 1955 (In Dutch) [Haarlem, Netherlands].

Bolt presents the history of a 3-year-old boy, whose mother noted one day that he became very quiet, though ordinarily he was lively, that his skin was yellow, and that he became drowsy and fell asleep. He was fed on awakening but he vomited, and his urine was brownish-black. Abdominal pain developed and recurred after another period of sleep. Examination suggested a sudden severe hemolysis. Poisoning, possibly with the insecticide parathion, was thought of, but the clinical picture differed from parathion intoxication. After a transfusion of 300 cc. of blood and other measures, the boy recovered. The true cause of the hemoglobinemia and hemoglobinuria was not ascertained until the author read A. H. Becker's report (*J. A. M. A.* **155:**1158 [July 24] 1954) on the treatment of favism with cortisone. It was then recalled that fava beans (Vicia faba) were among the foods consumed by the child before the onset of his illness and that his symptoms corresponded to those of favism, which is an allergic form of hemolytic anemia caused by contact with the pollen, or by ingestion of the seed, of the fava bean.

SURGERY

Experiences with the Beck Operation for Coronary Artery Disease. M. W. Selman. Dis. Chest **28:**1-20 (July) 1955 [Chicago].

Experiments carried out on dogs provided ample evidence that the Beck 1 operation will protect the heart against death from ventricular fibrillation and will prevent ischemic areas responsible for angina. The Beck 1 operation is a one stage procedure that consists of four steps: (1) partial ligation of the coronary sinus; (2) abrasion of the epicardium and pericardium; (3) application of asbestos powder over the surface of the heart; and (4) approximation of a pedicle of mediastinal fat to the heart. Selman participated in the performance of this operation by Beck on 31 consecutive patients with coronary artery disease. There were no operative or immediate postoperative deaths. Of 32 consecutive patients who underwent this operation and were followed up postoperatively for at least six months, the cardiac status was excellent in 10 who were able to perform full-time work with little or no pain; the cardiac status was good in 12 who were able to perform full-time or part-time work with significant reduction in pain; 6 patients were able to perform more work than before the operation with some diminution of pain; and 4 patients were therapeutic failures. The fact that 87.5% of the patients operated on were improved and 69% had obtained excellent or good results shows the effectiveness of the operation. The number and size of myocardial infarcts after coronary occlusion were significantly reduced in dogs protected by the Beck 1 operation. The Beck operation cannot stop degenerative and occlusive disease in the coronary arteries. The Beck procedure cannot restore degenerated myocardium and is therefore contraindicated in patients in whom destruction of the myocardium from infarcts has resulted in myocardial failure. The occlusive coronary artery disease may be so rapidly progressive that it overtakes the benefit derived from the operation. The Beck operation results in an increase in the intercoronary and extracoronary communication, thereby augmenting the natural tendency of the heart to increase blood supply to the myocardium following coronary occlusion or narrowing. There is ample experimental and clinical evidence to warrant the widespread application of the Beck operation to properly selected patients with coronary artery disease.

Factors Influencing the Late Results of Mitral Valvuloplasty for Mitral Stenosis. L. B. Ellis and D. E. Harken. Ann. Int. Med. **43:**133-142 (July) 1955 [Lancaster, Pa.].

Of 500 patients undergoing mitral valvuloplasty for predominant mitral stenosis without important associated disease, 13 had been classified as group 2 patients who had some impairment of function, usually dyspnea, which was not progressive; 342 were group 3 patients with chronic dyspnea or repeated attacks of acute dyspnea or pulmonary edema; and 145 were group 4 patients most of whom had had chronic congestive failure. Patients who presented a murmur of mitral stenosis but had no significant symptoms were classified as group 1 patients and were not subjected to valvuloplasty. There were 58 operative deaths. The operative mortality in groups 2 and 3 is now less than 3% and appears to be below 1%. It is 20% in group 4. Two patients were lost to follow-up, and 440 were followed up for an average of 22 months. Of the 440 patients, 343 (78%) showed significant and usually persistent improvement. The factors that led to less good results were (1) age over 40; (2) auricular fibrillation; (3) associated aortic valve disease; (4) associated mitral insufficiency of moderate degree or more; (5) a preoperative valve size of more than 1 square centimeter; (6) a postoperative valve size of less than 2.5 square centimeters; and (7) calcification of the mitral valve. Even in the less successful categories the over-all results were still good in most of the patients. Poor late results occurred in direct proportion to the number of adverse factors present. Mitral valvuloplasty appeared to protect against late peripheral embolization, although the incidence of operative emboli was somewhat greater in patients who had had previous emboli than in the group as a whole. Good end-results depend on intelligent and careful selection of patients and on the quality of the valvuloplasty performed by the surgeon.

Pulmonary Resections in the Light of Functional Tests. G. Vargha. Ztschr. Tuberk. **106:**154-161 (No. 3) 1955 (In German) [Leipzig, Germany].

Pulmonary resections produce irreversible changes, and it is essential that as much functioning tissue as possible be preserved. The author surveys the functional factors that must receive attention in pulmonary resections, discussing these factors on the basis of literature reports and of his own observations. He investigated the respiratory capacity before operation, during the postoperative period, and after the respiratory function had become stabilized again. In more than 200 preoperative examinations and in 100 control tests after resections, he found that pneumonectomy reduced the vital capacity by an average of 13% and the maximum breathing capacity by 10%. Lobectomy reduced the vital capacity by 7% but did not alter the maximum breathing capacity. Segmental resection caused on the average an 8% reduction in vital capacity and a 1% reduction in the maximum breathing capacity. The author also found that complications caused a much greater impairment in pulmonary ventilation than is indicated in the average values. When, after ineffective collapse therapy, lobectomy was combined with decortication or when a lobe was resected that contained a residual cavity, then lobectomy produced only a minimal loss in ventilatory capacity, or it even improved ventilation.

Cavernolithiasis. K. Kivikanervo, H. Laitinen and M. Wäre-Niskanen. Ann. chir. et gynaec. Fenniae **44:**1-9 (No. 1) 1955 (In English) [Helsinki, Finland].

In the course of radiological examinations carried out at their clinic, the authors discovered three patients whose lungs exhibited sharply outlined opacities of varying sizes and shapes. In two patients the opacity was within a tuberculous cavity, and in the third, the fragment had apparently moved from the cavity into the communicating bronchus and had become wedged there. The authors designate these fragments cavernoliths, a term used by Cooley in 1953. The authors were able to find only one other report on this condition besides Cooley's, that by Nagel and Hoppe in 1954. Cooley believed that cavernoliths are due to the eruption of parenchymal, caseous, and partly calcified foci into a bronchus; a cavity is formed and larger calcified fragments, which do not pass through the bronchus, remain in it. The authors are inclined to think that the formation of cavernoliths can also take place later, as a result of calcification of pus inside an open cavity. It has also been suggested that cavernoliths may simply be Simon's foci remaining within the cavity after the destruction of the surrounding pulmonary parenchyma. The authors feel that one of their cases indicated such a causation. As regards the diagnosis, they found that laminograms provided a good view of the cavernoliths. Their own experience with collapse therapy (thoracoplasty in two cases and pneumothorax in another) convinced them that complications are likely to result. They agree with Cooley that resection is the only therapeutic measure promising satisfactory results.

Surgical Considerations in Pulmonary Coccidioidomycosis: Report of 100 Cases. B. H. Cotton, G. A. Paulsen and J. W. Birsner. Am. J. Surg. **90:**101-106 (July) 1955 [New York].

Complications of pulmonary coccidioidomycosis are now a problem throughout the nation. During the second World War and during the Korean War, millions of troops were in endemic areas, and there has been a rapid postwar expansion of populations in endemic areas. The following complications of pulmonary coccidioidomycosis may occur as sequelae of the acute infection: extreme hilar adenopathy, coccidioma, pleural effusion, bronchiectasis, fibrosis, cavitation, and dissemination. One of the authors reviewed 750 cases of pulmonary coccidioidomycosis, nearly all of which were observed during the past decade in Kern County, Calif. Surgical treatment was employed in 100 of the 750 patients. From medical observation on these 100 patients, endoscopic examinations, surgical findings, and reviews of pathological specimens, the authors evolved the following indications for operations: (1) giant cavity; (2) secondarily infected cavity; (3) check-valve cavity; (4) ruptured cavity (pleural effusion, spontaneous pneumothorax, empyema, bronchopleural fistula, nonexpansile lung); (5) coccidioma; and (6) continued or severe hemoptysis. The authors comment on these different indications. Once the acute phase of the disease has passed, the risk of dissemination following surgery is almost negligible. The authors have seen cavities close during the first six month period but never after six months, and so they believe there should be a six month interval between resolution of the acute stage and surgical treatment. Attempts are made to localize the cavity before operation in order to ascertain whether or not localized resection will be possible or whether lobectomy will have to be performed. A bronchogram is always done next, for in many cases bronchiectasis was found associated with the cavity or within the area of infection. After the bronchographic examination, the authors wait six weeks before resorting to surgical treatment, which is carried out in the same manner as for other pulmonary lesions. The diagnosis was always confirmed either before or after the operation by one or more of the following procedures: complement fixation test, sputum examination, culture, animal inoculation, or histological examination. The operation was successful in all but three of the patients. One patient died during the postoperative period, and in two patients further cavities developed, which required second operations. One patient's second cavity was of tuberculous origin. The other patient's was coccidioidal; apparently either a small cavity was missed at the time of surgery or a small coccidioma "shelled out" to become a large cavity. It may prove easier to make a diagnosis of coccidioidomycosis in vivo than by examination of the pathological specimen. The coccidioidal cavity allows recovery of spherules from the sputum during the acute phase of the disease, but it may lose its identity due to superimposed infection by tubercle bacilli or pyogenic organisms. "Masking" of this type may explain pathologists' reports of a "granuloma of unknown etiology." The authors feel that resection for pulmonary coccidioidomycosis may prevent death and is effective in arresting the disease process. The decision to resort to surgery should be based on mechanical considerations, with complete disregard for the etiological agent, Coccidioides immitis. The coccidioidal cavity is, like lung abscess or bronchiectasis, an operable condition.

Pulmonary Histoplasmosis. T. F. Puckett. Am. J. Surg. **90:**92-100 (July) 1955 [New York].

Histoplasmosis is a highly infectious mycosis caused by Histoplasma capsulatum and presents a variety of clinical, pathological, and roentgenologic manifestations. The usual route of infection is the respiratory passage giving rise to primary foci within the lungs. Histoplasmosis has a tendency to occur in epidemics following exposure in heavily contaminated areas by groups of persons. There is evidence that a chronic active form of pulmonary histoplasmosis exists that closely mimics pulmonary tuberculosis. Some of these cases may be reinfection histoplasmosis. Chronic pulmonary histoplasmosis is intermediate between uncomplicated primary histoplasmosis and widely disseminated histoplasmosis. It is also the form that appears to be amenable to surgical therapy. The series reviewed consists of 67 patients from which pulmonary tissue, hilar nodes, or both were removed and H. capsulatum identified in the resected material. The disease process seemed to have become stabilized in all these patients and is probably best classified as healed or healing primary histoplasmosis. All patients had a history of residence in endemic areas, and almost half were in the age group 21 to 30 years. Many were admitted to an Army hospital with a diagnosis of "tuberculoma" and others with "coin lesion" of the lung. A presumptive diagnosis of histoplasmosis was made in several patients who were asymptomatic and were positive reactors to intradermal histoplasmin and negative reactors to intradermal coccidioidin and tuberculin. There were 31 patients who were completely asymptomatic and in whom the lesions were found by routine chest roentgenograms taken for reenlistment, annual physical examinations, or in connection with investigation of complaints other than those referable to the pulmonary system; 8 patients complained of malaise, easy fatigue, and weight loss; 8 had blood-streaked sputum; one had two bouts of hemoptysis; 8 had fever associated with symptoms referable to the upper respiratory tract; 10 complained of transient pleural pain; 15 estimated their onset to coincide with a rather mild but prolonged upper respiratory infection; 5 presented the typical symptoms and clinical findings of a middle lobe syndrome; and in 4 patients the lesions were incidental findings in pulmonary tissue removed for the treatment of other conditions. Complement fixation tests were negative in 15 of 30 patients, and the collodion agglutination test was negative in 23 of the same 30 patients. The intralobar location of the lesion was ascertained in 64 of the patients. This author had previously mentioned the difficulties in identifying H. capsulatum in focalized lesions, and on the basis of further studies he emphasizes that organisms cannot be identified in necrotic foci when sections are stained with hematoxylin and eosin. The periodic acid-Schiff stain as modified by Kligman and Mescon has proved to be a most satisfactory procedure. Unfortunately, it is not specific for cytoplasm and it is therefore frequently necessary to use the oil immersion lens for confirmation, as concretions, cellular inclusions, and other artifacts may simulate H. capsulatum. A complete history and the response to intradermal antigens should be known when tissues from granulomatous lesions are examined. Classically, H. capsulatum has been described as an intracellular inhabitant, but that is not the case with organisms found in the central necrotic portions of granulomas. In the older lesions the organisms may assume a somewhat atypical morphology, and attempts to cul-

ture them from resected lesions have been disappointing. The author believes that the organisms in the stabilized residual foci are generally nonviable.

Bilateral Resection Therapy in Pulmonary Tuberculosis. J. K. Kraan. Dis. Chest **28:**44-58 (July) 1955 [Chicago].

The author subjected 14 patients with bilateral pulmonary tuberculosis, in whom the disease was confined to at most two segments of each lung, to bilateral resection. The first operation was carried out on the side on which there was the least risk of loss of function. Should a complication arise in the second operation, the danger for the patient would thus be minimal. Surprisingly good results were obtained with bilateral resection in the first six patients, who have resumed their occupations after eight months of postoperative treatment in the sanatorium. These were all young persons between the ages of 21 and 31, who, even though their tuberculosis was only slightly active, were socially incapacitated because of the presence of tubercle bacilli in their sputum, as was revealed by preoperative weekly examinations of their expectoration. It is impossible to say with absolute certainty that they are permanently cured, but this is true for every recovered tuberculous patient. The most important tuberculous foci have been removed, and it is to be expected that, with prolonged after-treatment and a sensible way of living, they have a reasonable chance of gaining the fight against the pathogenic agent with their own defense powers. It was of great importance that the resection was always as selective as possible and that it was always possible to carry out segmental resection except in one patient in whom the whole upper lobe including the lingula had to be removed. This may be the explanation for the slight loss of function that was observed in the author's patients. The total loss of vital capacity and of maximum respiratory minute volume after successful lobectomy is sometimes not much greater than after segmental resection because it is possible that after the latter intervention the spared portions of the lobe participate little in the ventilation and gas exchange. The author believes that, when the expansion of the lung is good, as it was in his patients, these portions are still of significance and the loss of oxygen uptake of the operated lung can be small. Determinations of pulmonary function after uncomplicated bilateral resections in three of the six patients revealed a slight drop of vital capacity varying from 1.4 to 3.6%, while the maximum respiratory minute volume was reduced by 3.1 and 3.6%, respectively, in two of the patients and was increased by 9.1% in one patient. It is this slight loss in pulmonary function that makes the author believe that, in patients with a localized bilateral tuberculous process, resection therapy constitutes the only possibility of obtaining clinical cure with complete restoration of work capacity.

Adrenal Cortical Hyperfunction (Cushing's Disease): Clinical and Biochemical Study: Results of Subtotal Bilateral Adrenalectomy. J. Decourt, E. Baulieu, J. P. Michard and J. Lerner. Presse méd. **63:**951-954 (June 22) 1955 (In French) [Paris, France].

A particularly malignant syndrome of adrenal cortical hyperfunction (Cushing's disease) with early arterial hypertension was seen in a woman aged 29. First clinical signs appeared abruptly five months after termination of a normal pregnancy, her third, at the time of weaning of the infant. A thorough biological study showed slight increase in the 17-ketosteroids, bearing electively on Jayle's C fraction (17-ketosteroids oxygenated in 11); high elevation of the corticoids as measured by different methods (Heard-Sobell, Gornall, Porter-Silber reactions); slight increase in the glycuroconjugated and sulfoconjugated neutral steroids; and normal amounts of estroids. The patient received five sessions of pituitary roentgen irradiation, with no effect. Then the left adrenal gland was removed almost in its entirety, resulting in no clinical improvement but a transient improvement in the hypertension. A month later about half the right gland was removed, with dramatic improvement. Histological examination of the two glands revealed diffuse spongiocytic hyperplasia of the cortex. Several weeks after the second intervention, signs of postoperative adrenal cortical insufficiency appeared, in the form of eczematous eruptions, arthralgia, abdominal pain, and vomiting. These were successfully treated with cortisone. Biological examination four months after operation showed a permanent decrease in the 17-ketosteroids to about 1 mg., subnormal amount of corticoids, and feeble response to the intravenous infusion of corticotropin. Eight months after the operations the patient was seen to be in good health. She had gained in weight; the facies, skin color, and blood pressure were normal; menstruation had reappeared; and psychic balance was restored.

Endoscopic-Transthoracic Approach in Surgical Intervention on Autonomic Nervous System According to Kux. F. Rosenauer. Wien. med. Wchnschr. **105:**524-526 (June 25) 1955 (In German) [Vienna, Austria].

Endoscopic-transthoracic exclusion of the sympathetic and vagus nerves using Kux's technique (*J. A. M. A.* **147:**1076 [Nov. 10] 1951) was carried out by Rosenauer in 300 patients with various disorders such as hyperhidrosis of the hands and the face, essential hypertension, postcholecystectomy syndrome, disturbances of circulation and phantom pain in the upper extremities, causalgia, duodenal ulcer, angina pectoris, and severe spastic constipation. Illustrative cases are reported. Three patients, a stenotypist, a nurse, and a clerk, with severe hyperhidrosis of the hands, obtained dry, warm hands from bilateral division of the upper thoracic sympathetic chain. In two patients, hyperhidrosis of the face of several years' duration subsided completely after division of the sympathetic nerve distal to the stellate ganglion. Bilateral endoscopic division of the thoracic sympathetic chain and of the splanchnic nerves at several points was carried out in a patient with essential hypertension associated with vertigo, headache, and complete loss of sense of taste. Follow-up after two years showed a maximal systolic pressure of 190 mm. Hg as compared with 240 mm. Hg before the operation. The patient had regained his sense of taste, and headache and vertigo did not recur. Of five patients with postcholecystectomy syndrome, two obtained complete freedom from their symptoms as a result of splanchnicotomy on the right side, and the other three were considerably improved. In a 70-year-old farmer, endoscopic division of thoracic sympathetic chain distal to the stellate ganglion, approximately at the level of the second rib, resulted in complete cure of refractory excruciating phantom pain occurring 30 years after amputation of the right upper arm. The author's results obtained with Kux's technique in 53 patients with duodenal ulcer were less satisfactory than those reported by Kux himself. Bilateral division of vagus and of sympathetic fibers is indispensable, but a definite disadvantage of the endoscopic division of these nerves in patients with duodenal ulcer is the fact that surgical intervention is carried out in the pleural space and that one does not know definitely whether the diagnosis of conditions in the abdomen is not erroneous. In very young patients with duodenal ulcer and in those in whom the roentgen findings do not seem to justify resection and who have severe pain refractory to conservative therapy, Kux's technique should be employed and may yield satisfactory results in 55% of the patients. Two patients with highly refractory constipation caused by permanent spasm of the left portion of the colon had regular bowel movements every day or every second day after endoscopic division of the left vagus nerve. It has been possible in many patients to interrupt rapidly, without major surgical intervention, the waves that pass from the autonomic nervous system to the organs, or from the organs through the fibers of the autonomic nervous system to the central nervous system, and for this reason the method becomes indispensable when the autonomic nervous system is considered more and more as the cause of organic diseases.

Congenital Aganglionic Megacolon. H. Axelrod. Am. J. Surg. **90:**18-25 (July) 1955 [New York].

Axelrod reviews the history of investigations on the pathogenesis and treatment of congenital aganglionic megacolon, also known as Hirschsprung's disease. The disease is in the distal, undilated portion of the large intestine, rather than in the dilated portion, which contributes the word megacolon to the designation of the disease. The dilated portion of the intestine, with its greatly increased lumen, thickened wall, and elonga-

tion represents the reaction of a normal bowel to a chronic obstruction distal to it. In the narrowed segment distal to the dilated portion of the colon, the ganglions of Auerbach's plexus are absent but nerve fibers are present, which are nonmyelinated and lie where Auerbach's plexus would normally be situated. When the nerve impulse from the proximal, normal portion reaches this part of the bowel, an intense spastic contraction takes place, the lumen of the bowel is greatly contracted, the normal peristaltic wave reaching it is ended, and with it the forward propulsion of the bolus. Feces are packed into the first portion of the narrowed part of the bowel. This part of the fecal stream can move forward only by sufficient push from the propulsive efforts of the bowel orad to it. Meanwhile, though the aganglionic part of the bowel is incapable of peristaltic function, its other functions are not impaired. Water absorption from the feces continues, and as it does the feces become drier and harder. With the feces now backing up into the normal bowel, dilatation of the latter occurs. If the blockage is complete, acute intestinal obstruction results. The diagnosis of congenital aganglionic megacolon is not too difficult. Obstinate constipation becomes apparent at or shortly after birth. These children will have bowel movements so long as enemas are given, but despite the administration of enemas the overwhelming majority of children will appear with a greatly distended abdomen. When acute intestinal obstruction occurs and is complete, laparotomy will be necessary, with the shortest possible procedure consistent with saving the patient's life. This will usually consist of a transverse loop colostomy proximal to the contracted segment. The author describes Swanson's curative operation with Hiatt's modification, which consists of removal of the entire narrowed, distal segment, the transitional area and a variable part of the distal dilated part of the colon. The author presents the histories of two children, a 6-year-old boy and a 2½-year-old girl who were treated by this operation, which illustrate the excellent results that can be achieved by operative correction of this congenital anomaly.

NEUROLOGY & PSYCHIATRY

The Clinical Syndrome of Aneurysm of the Middle Cerebral Artery. K. Frankel and B. J. Alpers. A. M. A. Arch. Neurol. & Psychiat. **74:**46-67 (July) 1955 [Chicago].

Aneurysm of the middle cerebral artery has usually been detected at autopsy. The authors analyzed 12 cases of aneurysm of the middle cerebral artery verified at operation or autopsy in order to define the clinical syndrome and to determine the criteria whereby the diagnosis may be established before rupture. They surveyed the literature and located 129 cases, but the records of only 75 were found to be sufficiently complete to warrant inclusion for study. Data on the two groups of patients are analyzed and compared. In the cases reported in the literature the majority of patients were 20 to 50 years of age, whereas in the 12 patients presented here the ages ranged between 30 and 59. Men predominated. In the majority of patients, symptoms were of less than one week's duration, but in some they had been present for from one month to 15 years. The clinical syndrome of aneurysm of the middle cerebral artery prior to rupture is ill-defined. In the series here reported the only symptom of significance prior to rupture consisted of headache of a nonspecific character. This was true also of the cases recorded in the literature. Seizures were recorded in a few instances and transient weakness in others. In the great majority of recorded instances of aneurysm of the middle cerebral artery, the diagnosis has been made after rupture. The onset under these circumstances has usually been with loss of consciousness, often with focal or generalized seizures, and hemiplegia. Neurological examination has usually, but not always, revealed hemiparesis or hemiplegia, at times changes in the fundi, occasionally hemianopsia, and a scattering of other findings. Signs of meningeal irritation were frequent, due to subarachnoid hemorrhage. The spinal fluid usually contained red blood cells or was xanthochromic, and the pressure tended to be elevated. Little information was obtained from radiological studies. It is not possible to indicate a group of symptoms that could be regarded as significant for diagnosis prior to rupture. It is only possible to state that in patients with long-standing, unexplained headache, with occasional seizures and transitory episodes of hemiplegia or aphasia, the possibility of aneurysm of the middle cerebral artery should always be considered and arteriography performed. After rupture it is not always possible to be certain whether the symptoms result from aneurysm, hemorrhage into a tumor, or cerebral hemorrhage of hypertensive origin.

Reserpine in the Treatment of Psychotics with Convulsive Disorders. J. A. Barsa and N. S. Kline. A. M. A. Arch. Neurol. & Psychiat. **74:**31-35 (July) 1955 [Chicago].

The value of reserpine, a crystalline alkaloid from the root of Rauwolfia serpentina, in the treatment of disturbed psychotics has been shown in previous studies. Since there was an indication that patients with convulsive disorders did not respond to treatment as well as the others and since at times the incidence of convulsive seizures seemed to be increased, three groups of patients with convulsive disorders were studied. The first group included 11 schizophrenic patients with occasional convulsive seizures, which in all but two of the patients had begun late, that is, between the ages of 25 and 55. The second group included 25 patients whose mental symptoms were believed to be secondary either to epilepsy or to mental deficiency. Convulsive seizures in all of these patients began in early life and occurred more frequently than in the first group. All, with but one exception, required anticonvulsant medication. The third group included seven schizophrenic patients who had undergone various forms of psychosurgery (three, topectomies, and four, prefrontal lobotomies) and who had had convulsive seizures at some time following the operation. None of these patients received anticonvulsant medication at the time of this study. At the onset, reserpine therapy was given orally and intramuscularly, but for maintenance oral therapy was used. It was found that reserpine therapy is not as effective in psychotic patients with convulsive disorders as in psychotics without convulsive seizures. In the former the maximum therapeutic effect to be expected is usually one of sedation. There is an increased incidence of convulsive seizures during the first six weeks of therapy. In treating epileptics with reserpine, it is recommended that therapy be begun with small oral doses and that the dosage be built up gradually. Intramuscular administration of reserpine is not necessary in most cases. Finally, in termination of therapy, the drug should be withdrawn very gradually lest convulsive seizures be precipitated. The question arises as to why the mental symptoms of patients with convulsive disorders did not respond so well to therapy as did those of patients without convulsive seizures. The explanation may be that in the former the mental symptoms, like the seizures, are organically determined and, therefore, not as amenable to drug therapy. Another point to consider is that the paranoid element was usually predominant in the symptomatology of these patients with convulsive disorders, and this symptom is known to be particularly resistant to all forms of therapy.

Peritoneal Shunts in the Treatment of Hydrocephalus and Increased Intracranial Pressure: Four-Year Survey of 62 Patients. I. J. Jackson and S. R. Snodgrass. J. Neurosurg. **12:**216-222 (May) 1955 [Springfield, Ill.].

Increased intracranial pressure in patients with hydrocephalus can sometimes be successfully relieved by shunting the excess cerebrospinal fluid from the lumbar subarachnoid space or the ventricles into the peritoneal cavity through a catheter. This method has been used in 62 patients ranging in age from 3 days to 65 years, studied over a period of four years at the University of Texas. A plastic tube with several side vents is introduced either into the right lateral ventricle or the left lumbar subarachnoid space and is fixed in position. Its free end is threaded subcutaneously, either downward on the anterior surface of the trunk for a ventriculoperitoneal shunt or around the trunk to the left lower abdominal quadrant for a lumbar-peritoneal shunt, and the peritoneal cavity is then opened to receive the tube. During the last 18 months, the opening has been made over the liver, instead of lower down, and the tube has been placed over the dome of the liver and fastened to the falciform ligament by a suture. Blocking and kinking of the tube were

frequent complications, and in many cases the failure of the tube to function led to a recurrence of the initial symptoms and necessitated reoperation. A second operation was also needed in some of the children because they outgrew the original tube. The total number of operations in these 62 patients, therefore, was 116. One patient was lost to follow-up; 20 died with increased intracranial pressure, although in none of these was the death a direct result of the operation; and 12 others died from various causes, but their intracranial pressure was not increased. Some of the shunts are working and necessary for life; others are now obviously neither working nor necessary, indicating that a temporizing procedure may occasionally tide the patient over until he is able adequately to absorb his excess cerebrospinal fluid. The 29 surviving patients include 22 who are free from increased intracranial pressure and 7 in whom the pressure is now increased in spite of one or more shunting operations. Experience with peritoneal shunts shows that the longer the patients are followed, the poorer the long-term results become; thus only 39% of these patients have received long-term benefit, but, since only two of those with successful shunts are not leading useful or relatively normal lives, the shunting procedure should be regarded as having a certain limited value.

The Use of Hypothermia in Surgical Treatment of Cerebral Vascular Lesions: Preliminary Report. W. M. Lougheed, W. H. Sweet, J. C. White and W. R. Brewster. J. Neurosurg. **12:**240-255 (May) 1955 [Springfield, Ill.].

Experience with two patients subjected to intracranial surgery under hypothermia at the Massachusetts General Hospital in December, 1953, shows that hypothermia protects the brain from anoxia and makes it possible to occlude the cerebral circulation for periods of as much as 14 minutes and 25 seconds without injury. The first patient, a 45-year-old man with a recurrent glioblastoma of the right cerebral hemisphere necessitating hemispherectomy, had an uneventful postoperative course except for tachycardia with pulse rate of 150 beats a minute and electrocardiographic inversion of the T waves in most leads for five or six days. He was alert, mentally oriented, and fully conscious the day after the operation and showed no signs of having suffered cerebral anoxia, although the total time of occlusion of the carotid arteries had been 135 minutes for the right and 45 minutes for the left. He was out of bed on the 50th postoperative day. The second patient, a 17-year-old boy with a large arteriovenous malformation, was also alert and talking on the morning of his first postoperative day. He did well until the morning of the fifth postoperative day, when he went into coma and died. Autopsy showed the right vertebral artery to be thrombosed from the site of its occlusion in the neck up to its junction with the basilar artery. The thrombosis was the result of arterial trauma produced by the occluding bulldog clamp. The clamps chosen for this operation were particularly stiff to insure complete occlusion of the blood supply, and the patient's neck was in such a position during the operation that it was very hard to see the vertebral arteries when applying the clamps; in future, injury to the arteries could probably be avoided by using rubber-shod Poppen clamps. The sum total period of occlusion for all four carotid and vertebral arteries in this patient was 47 minutes and 15 seconds, the longest single period being 14 minutes and 25 seconds. The electrocardiographic and electroencephalographic tracings showed no evidence of anoxia occurring in the heart or brain of either patient during the periods of hypothermia (six and seven hours, respectively) or those of circulatory arrest. Hypothermia is not without risk, but in certain carefully selected cases it may afford the neurosurgeon protection enough to enable him to deal definitively with cerebral vascular lesions.

Chlorpromazine in the Management of Acute Alcoholic States. J. D. Schultz, E. L. Rea, J. F. Fazekas and J. C. Shea. Quart. J. Stud. Alcohol **16:**245-250 (June) 1955 [New Haven, Conn.].

The fact that chlorpromazine produces relaxation, brings about sleep without stupor, reduces agitation, and controls vomiting suggested its usefulness in the management of acute alcoholism. Earlier studies on 64 alcoholic patients were sufficiently encouraging to induce the authors to use the drug in 100 additional patients. The group of 164 patients included 141 men and 23 women. Observations on the earlier series indicated that relatively large amounts of chlorpromazine had to be given. The severity of the physiological disturbance of the patient on admission determined both the dose and the route of administration. The standard dose was 100 mg. of chlorpromazine hydrochloride given intramuscularly on admission, followed by 50 mg. three times daily until symptoms subsided. In severely disturbed patients, 100 mg. of the drug was given intravenously in fluid dilutions, ranging from 10 to 20 cc. of isotonic sodium chloride solution administered in a few minutes to 500 cc. of 5% glucose in water or isotonic sodium chloride solution administered in 30 minutes. In a few of the severely disturbed patients, 150 mg. was given intramuscularly as the initial dose, but 100 mg. given intravenously proved more effective. The subsequent dose in the severely disturbed patient was frequently increased from the standard dose of 50 mg. orally three times daily to 75 or 100 mg. orally for the second or third dose. In a few instances the intramuscular route was used repeatedly. The total dose per patient ranged from 100 to 2,950 mg. over a period of one to six days. Liberal amounts of fluids, usually water and fruit juice, were given by mouth. The authors conclude that chlorpromazine in relatively large doses is extremely helpful in the management of acute alcoholic states. It controls motor excitement, nausea, and vomiting, permits a restful, relaxed sleep, and contributes to the relief of tension and anxiety. The patient retains fluids and nourishment, can be readily aroused for nursing care, and is quickly restored to physiological normalcy. No addiction to chlorpromazine developed, and there were few unpleasant side-effects. Orthostatic hypotension of moderate degree was fairly common at the onset of therapy, and occasionally this hypotension was severe. For this reason the blood pressure of patients given chlorpromazine should be watched closely, particularly when large doses of the drug are administered, and the patients should be kept in a recumbent position.

Chlorpromazine (Thorazine)—Rauwolfia Combination in Neuropsychiatry: Preliminary Report. H. B. Eiber. A. M. A. Arch. Neurol. & Psychiat. **74:**36-39 (July) 1955 [Chicago].

Preliminary testing with the combination of chlorpromazine and Rauwolfia serpentina was begun on 24 patients with such varied neuropsychiatric conditions as schizophrenic reactions, manic-depressive psychosis, senile agitated states, anxiety neuroses, menopausal agitation, epilepsy, primary behavior disorders, and mental deficiency. The subjects were all ambulatory and varied in age from 3 to 92 years. The patients received the combination of 15 mg. of chlorpromazine and 50 mg. of Rauwolfia serpentina (whole root) by mouth. The medicament was given three to four times daily. In some instances the dose was doubled or tripled. In the cases of smaller, younger patients, the dose was halved. No differences were observed when the whole root of Rauwolfia serpentina was replaced by one of its alkaloids, reserpine. The patients were observed first at weekly intervals and later at monthly intervals. There were only three patients who did not improve significantly with this treatment. All the remaining 21 patients showed moderate to marked improvement. It is suggested that this combination may act as a chemical agent on the corticothalamic centers, enabling patients to function at a more satisfactory level. The simultaneous use of the two medicaments appears to be of greater value than when either agent is used singly.

GYNECOLOGY & OBSTETRICS

Chemical Burns of the Vagina. M. J. St. Romain Jr. and F. G. Nix. J. Louisiana M. Soc. **107:**268-272 (July) 1955 [New Orleans].

St. Romain and Nix present observations on 75 women who were treated for chemical burns of the vagina at Charity Hospital, New Orleans, during the period from July, 1949, to July, 1954. A much larger number of chemical burns of the vagina, with less serious complications, were treated on an outpatient basis. The 75 women ranged in age from 17 to 45 years, and parity varied between 0 and 12, with 88% having four or more children. Of these women, 56 admitted using the agents in an attempt to produce abortions. In three instances, tablets

were inserted into the vagina in conjunction with intrauterine catheters and vaginal packs by midwives. These three patients, when first seen, showed evidence of pelvic infection. Potassium permanganate was used in 73 of the 75 women; in 52 the tablets were inserted into the vagina as abortifacients; in 21 the tablets or crystals were incompletely dissolved in water in the preparation of douche solutions and the undissolved particles resulted in vaginal burns. One patient used "Orange Blossom suppositories" (containing alum, borax, and petrolatum) to treat a vaginal discharge. Bleeding occurred three days after the insertion of the suppositories, and vaginal examination revealed multiple raw bleeding areas. The remaining woman used tablets of mercuric chloride as an abortifacient. The outstanding symptom of vaginal chemical burns was bleeding. Ulcerative vaginal lesions responsible for the bleeding were present in all patients. The treatment consisted of hemostasis, blood replacement, antibiotics, and antitoxins. Hemostasis was accomplished by sutures in 25 patients. Suturing was impossible in five patients, due to the extensive necrosis, and vaginal packs were used to control the hemorrhage. Transfusion was required in 59 patients; 32 patients received antibiotics. Tetanus and gas gangrene antiserums were administered to 18 patients. The three patients with pelvic infection were treated with nasogastric suction and intravenous fluids in addition to the above forms of treatment. Potassium permanganate is becoming popular among the uneducated and malinformed as an abortifacient, but it is ineffective. Of the 56 women who admitted using the chemical agents as abortifacients, 5 were not pregnant on admission; 6 patients were pregnant but did not return to Charity Hospital for follow-up; and there were 45 cases of proved pregnancies that were followed to termination. These pregnancies resulted in 38 term live births, 2 stillbirths, and 5 abortions. Potassium permanganate used for a cleansing douche may produce serious vaginal burns, if any undissolved crystals come in contact with the vaginal mucosa.

Paracervical Uterine Denervation by Transection of the Cervical Plexus for the Relief of Dysmenorrhea. J. B. Doyle. Am. J. Obst. & Gynec. **70:**1-16 (July) 1955 [St. Louis].

Pain synchronous with menstrual bleeding usually referred to as dysmenorrhea occurs in two forms. The pain of primary or essential dysmenorrhea usually occurs during very early menstrual life. It is crampy or colicky in type, localized usually to the low midline hypogastric area, and occurs synchronously with the onset of menstrual flow, although it may precede it for several hours. Its duration is usually several hours to two days. The pain of secondary or acquired dysmenorrhea usually occurs after several years of menstrual life, often not until the second or third decade. It is of a diffuse, dull, aching character and may occur in one or both iliac fossae as well as in the midline. Occasionally, the pain radiates to the lower sacrum or to the medial and posterior thigh or into the vagina. Many young women with primary dysmenorrhea are assured that marriage and childbearing will relieve the condition. Unfortunately, this does not always happen. Of the numerous theories regarding the cause of dysmenorrhea, the most generally accepted is that the discomfort arises chiefly from hypercontractility of the uterine musculature due to an imbalance of its regulators, estrogen and progesterone. Most gynecologists agree that most patients with primary dysmenorrhea will respond to sedation, rest, hygiene, and production of anovulation either by estrogens or testosterone. These remedies are less satisfactory for the acquired type of dysmenorrhea. Temporary relief can usually, but not always, be obtained by prolonged dilatation of the cervical canal. The relative inadequacy of the presacral neurectomy procedure in the relief of both primary and secondary dysmenorrhea is well known, and it has been virtually abandoned for patients with acquired dysmenorrhea at many clinics. Many European gynecologists relieve uterine pain by transection of the intersacral ligaments. The author mentions various denervation procedures and describes his own experience with the transection of the cervical division of the Lee-Frankenhäuser uterovaginal plexus lying in, around, and under the terminal 2.5 cm. of the uterosacral ligaments. It permits sensory denervation of the cervix and fundus of the uterus and the proximal segment of the tubes. The procedure may be done during laparotomy or culdotomy. Since the culdotomy approach is the first step of a vaginal hysterectomy, gynecologists may prefer the vaginal approach particularly if the illumination is improved by the use of the pelviscope set, which consists of a lighted right-angle retractor with twin lights at its tip and a set of two telescopes offering right angle or 45° angle fields of vision with a threefold magnification. The general surgeon may prefer the abdominal approach. It has been the author's practice to reserve the vaginal approach for those patients with dysmenorrhea in whom pelvic examination, both vaginally and rectally, revealed tenderness but no nodulation in the uterosacral ligaments and a cul-de-sac free of induration or masses. The vagina must be free of infection. In the series of 73 cases reviewed in this paper the denervation was done by the vaginal route in 36 cases and by the abdominal route in 37 cases. Neuromuscular and neurovascular autonomic imbalance is avoided with this technique of uterine denervation since both sympathetic and parasympathetic pathways are interrupted. Relief of acquired dysmenorrhea with or without antecedent primary dysmenorrhea was obtained in 69 of 73 cases. The relief was complete in 63 cases. There was no interference with the function of the bladder or rectum. The regrowth of the nerves is prevented by the interposition of the posterior parametrial peritoneum between the transected uterosacral ligaments and the top of the vagina.

PEDIATRICS

Experiences with 180 Cases of Tetralogy of Fallot in Infants and Children. R. D. Rowe, P. Vlad and J. D. Keith. Canad. M. A. J. **73:**23-30 (July 1) 1955 [Toronto, Canada].

Advances in diagnostic technique during the last 10 years have opened the way to the correct diagnosis of the tetralogy of Fallot in small infants and children with cyanotic heart disease. Congestive heart failure never occurs during childhood in the natural course of this malformation; consequently, the finding of an enlarged liver with gallop rhythm in a cyanotic child before surgical intervention excludes a diagnosis of tetralogy of Fallot. Some of the more serious cardiac malformations found in infants may have closely similar physical signs, radiological picture, and electrocardiographic alterations, and this often makes differential diagnosis difficult. Early determination of the correct diagnosis, however, is important from a prognostic point of view and full advantage should be taken of such accessory procedures as chest radiography, electrocardiography, ear oximetry, cardiac catheterization, and angiocardiography. Anoxia is the chief cause of death in children with this condition. Those who survive the dangerous first two years show a certain amount of adaptation to anoxia; they are aware of their limitations and often employ maneuvers such as squatting or lying on one side to relieve discomfort or dyspnea. The average age of survival, however, is only 12 years and very few patients survive the second decade. The records of the 180 patients with the tetralogy of Fallot seen at the Hospital for Sick Children, Toronto, show that, of the 40 who died, 67% were less than 2 years old and 83% were less than 5. Medical treatment should be used whenever possible to carry the patient through infancy until he reaches an age at which surgical correction of the defect can be carried out with greater safety. The best age seems to be between 4 and 5. Cyanosis is strikingly lessened in patients who have been operated on successfully, and their exercise tolerance is greatly improved. The purpose of the surgical treatment is to increase the pulmonary blood flow and, while it is not possible now to say how long the improvement will last, the benefit still being enjoyed by patients who were operated on as much as 10 years ago augurs well for their future.

Blood Formation in Infancy: Part IV—The Early Anaemia of Prematurity. D. Gairdner, J. Marks and J. D. Roscoe. Arch. Dis. Childhood **30:**203-211 (June) 1955 [London, England].

In premature infants the postnatal fall in hemoglobin level tends to be exaggerated, so that these infants, although starting life with a cord hemoglobin as high as that of normal infants, often develop abnormally low hemoglobin levels during the second month. Usually this early anemia of prematurity slowly improves after about age 4 months but is frequently fol-

lowed by a second phase of anemia. This late anemia of prematurity does not differ from the hypochromic anemia common in other infants of over 6 months. It reflects the precarious iron balance during infancy, exaggerated by several factors that bear on the premature infant, such as its smaller initial iron stores, its more rapid growth, and its tendency to receive a purely milk diet for a prolonged period. The cause of the early anemia of prematurity has, however, never been understood. Three different mechanisms have been suggested: (1) that the anemia results from abnormally high rate of destruction of red blood cells; (2) that it is the result of the rapidity of body growth outstripping a normal erythropoietic capacity; and (3) that it is the result of a functional immaturity of the bone marrow, a dyshemopoiesis. Each of these three suggested mechanisms was examined by the authors in the light of data obtained in 31 infants having birth weights below 1,620 gm. (3 lb. 9 oz.). The main study concerns a group of 26 infants, to half of whom additional iron was given, while another 5 infants received cobalt as well as iron. The authors found that the early anemia of premature infants is due mainly to the slow response of erythropoiesis to the stimulus of anemia. This slow response is not peculiar to premature infants, but in them its consequence is exaggerated by the rapidity of their growth. Rapid growth also has the effect of prolonging the anemia once it has developed. There is no evidence that an abnormal rate of red blood cell destruction, if it occurs, contributes significantly to the production of anemia. Marrow studies reveal no differences between the myelograms of premature and normal infants. Iron, if given from about the third week, mitigates the anemia but does not always prevent it. Iron is well tolerated and there seems good reason to give it to the smaller premature infants from about the third or fourth week. If cobalt is given in addition to prophylactic iron, a striking increase in erythropoiesis can be provoked, sufficient in most cases to prevent anemia. However, the effects that cobalt may have upon the thyroid make it unjustifiable to administer it routinely to premature infants.

The Schönlein-Henoch Syndrome (Anaphylactoid Purpura) Compared with Certain Features of Nephritis and Rheumatism. I. C. Lewis. Arch. Dis. Childhood **30:**212-216 (June) 1955 [London, England].

Similarities between acute rheumatism, acute nephritis, and anaphylactoid purpura, also known as the Schönlein-Henoch syndrome, had been pointed out by Gairdner in 1948 who had also called attention to the fact that an upper respiratory tract infection associated with hemolytic streptococci preceded these conditions so commonly as to suggest bacterial hypersensitivity as an etiological factor. The present report enlarges upon some of the points raised by Gairdner. It is based on 139 cases of anaphylactoid purpura (Schönlein-Henoch syndrome), 297 cases of nephritis, and 307 cases of rheumatism. All of the children with anaphylactoid purpura (Schönlein-Henoch syndrome) had the characteristic exanthem and joint and/or abdominal symptoms. The children with this syndrome, those with acute hemorrhagic glomerulonephritis, and those with acute rheumatism were compared with regard to sex ratio, age of onset, seasonal trends, and the incidence of previous upper respiratory tract infections, particularly those associated with hemolytic streptococci. The authors feel that the evidence they obtained supports a close relationship between anaphylactoid purpura (Schönlein-Henoch syndrome) and acute nephritis, and a bacterial hypersensitivity as a major causal factor in all three conditions. The sharp rise in the numbers of cases of anaphylactoid purpura (Schönlein-Henoch syndrome) in the spring and autumn also suggests a relationship with respiratory tract infections.

THERAPEUTICS

Coronary Dilator Activity and Therapeutic Importance of a Synthetic Drug with a Kellinic Action: the 2-Phenylchromone. V. Ferrari and G. Finardi. Minerva med. **46:**1175-1180 (April 25) 1955 (In Italian) [Turin, Italy].

The effects of prolonged administration of 2-phenylchromone (Cromarile), a preparation whose activity, according to some authors, is two times greater than that of kellin, were studied in nine patients with coronary insufficiency. Doses ranging from 45 to 120 mg. daily never caused untoward reactions, and the beneficial effect of the drug was evident from the clinical, electrocardiographic, and functional standpoints. Total or almost total suppression of painful attacks was observed in four patients, while in three the attacks decreased in intensity and frequency. The effect of the drug was preventive and led to reduction or disappearance of the attacks in a few days. The effect was poor in two patients, in one of whom syphilitic coronaritis refractory to all symptomatic treatment was present, whereas the other had suffered a severe infarct. The arterial pressure of the patients was not influenced. The symptomatic action of Cromarile was studied in three persons who were subjected to the effort test. In all three, the test, which at first caused precordial pain, was painless after the administration of the drug. The electrocardiographic findings were improved in all the persons studied. Despite their limited experience, the authors state that the activity of 2-phenylchromone in dilating the coronaries from the functional as well as the symptomatic standpoint is extremely favorable, especially because doses that are effective are completely devoid of side-effects even when they are administered for months without interruption.

Clinical Experiences with a New 4-Oxycoumarin Derivative: Sintrom. S. Moeschlin and H. Schorno. Schweiz. med. Wchnschr. **85:**590-592 (June 11) 1955 (In German) [Basel, Switzerland].

The new coumarin preparation, Sintrom (3-nitrophenylacetylethyl-4-oxycoumarin), takes an intermediate position between the coumarin preparations that have a prolonged effect and those that have a short action. The authors have used it since September, 1954, in 50 patients for the treatment of thrombosis, pulmonary embolism, and cardiac infarct, and to prevent thrombosis after operations or trauma. The drug is available in 4 mg. tablets, which can be divided. It is tasteless and is willingly taken in water or tea. The daily dose need not be divided but can be given at once. The prothrombin level increases within 24 hours and subsides to the initial values in from 48 to 72 hours. Therefore it is comparatively easy to adjust to the optimal prothrombin level without a too protracted time of recuperation, which can be further reduced by the administration of vitamin K_1. The new drug has practical advantages over other anticoagulants and is of great value in internal, surgical, and gynecologic conditions. No undesirable secondary effects were observed, even during prolonged treatment of up to six months.

Yeast Dermatoses During Antibiotic Therapy: III. Pathogenic and Therapeutic Study, with Particular Reference to the Incidence of Avitaminosis. P. de Graciansky, R. Leclerq, J. Delaporte and P. Gouin de Roumilly. Semaine hôp. Paris **31:**2170-2182 (June 20) 1955 (In French) [Paris, France].

The various hypotheses proposed to explain the action of yeasts in certain untoward effects of antibiotic therapy are discussed, on the basis both of statements in the literature and of experiments conducted by the authors. Direct contact of various antibiotics with Candida albicans produced no noticeable effects on the latter, nor was there conclusive evidence that this organism acquires greater virulence when growing in the presence of an antibiotic agent. The administration of antibiotics to experimental animals does favor the germination of C. albicans, however. It must therefore be concluded that certain modifications of the terrain are induced, permitting the development of the disease caused by the yeast. The decimation of other organisms by the antibiotics with consequent disturbance of the floral distribution in favor of the pathogenic yeasts is a contributory factor but is not sufficient to explain the occurrence of the disease. The role of certain avitaminoses, notably that of avitaminosis B_2, seems to be established. The authors' experiments show that, contrary to past affirmation, vitamin B_2 does not possess fungistatic properties. Animals deficient in vitamin B_2 are definitely hypersensitive to infections caused by C. albicans, even when their deficiency is not enough to cause disturbances of the general condition. Two further factors mentioned in the literature, sensitivity to antibiotics and local irritation caused by antibiotics, do not appear to be important. Therapy of the yeast dermatoses caused by antibiotic treatment should consist not only of local and general applications of antifungal agents but of prophylaxis with the vitamin B complex.

BOOK REVIEWS

Denial of Illness: Symbolic and Physiological Aspects. By Edwin A. Weinstein, M.D., Associate Attending Neurologist, Mount Sinai Hospital, New York, and Robert L. Kahn, Ph.D., Research Psychologist, Mount Sinai Hospital, New York. Publication number 249, American Lecture Series, monograph in Bannerstone Division of American Lectures in Neurology. Edited by Charles D. Aring, M.D. Cloth. $4.75. Pp. 166. Charles C Thomas, Publisher, 301-327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications, Ltd., 49 Broad St., Oxford, England; Ryerson Press, 299 Queen St., W., Toronto 2B, Canada, 1955.

This monograph represents the culmination of eight years of intensive investigation of the behavioral changes in brain disease, with use of a combined neurological, psychiatric, and psychological approach. From many carefully controlled clinical studies of what superficially appear to be seemingly irrational behavior, the authors evolve clear evidence that denial of illness can be viewed as an orderly and understandable adaptation pattern to stress. This volume is a valuable monograph and carefully compiled, with adequate line drawings, complete references, and a valuable condensed table of clinical data of the 104 patients studied.

An introductory chapter considers the history of studies of denial of illness dating from the earliest cases described by Von Monakow in 1885, by Anton in 1896, and by Babinski in 1914. The authors then go on to describe the patterns of denial and list the following patterns of explicit verbal denial: (1) complete denial, (2) denial of major disability, (3) minimization or attribution to some benign cause, (4) projection of disability outside of the self, and (5) temporal displacement of the disability. They indicate that the denial of illness usually included more than one aspect of the illness, that the disability that was denied was not necessarily caused by a lesion of the nervous system, that patients with anosognosia for physical disabilities commonly denied the existence of other personal problems, and that confabulation was the device used to amplify the denial. The duration of anosognosia in patients varied from several days to one year; many patients who recovered showed amnesia for the period of denial. The patients with complete explicit denial showed no anxiety and were bland and affable during interviews. Other chapters consider the patterns of disorientation; reduplication manifestations; the language of denial; personality factors; anatomic and physiological factors; psychological studies; and experimental production of denial with special studies of the effects of barbiturates, the use of the Amytal test in the diagnosis of brain disease, and the effects of electric shock. A summarizing chapter also concerns itself with theoretical considerations.

The authors' data help to bury the ghost of overmeticulous cerebral localization, and they develop a comprehensive theory of the denial of illness as a reaction to stress. The book is highly recommended and should be read by every psychiatrist, neurologist, and internist.

How to Live Without Liquor. By Ralph A. Habas, Ph.D. With introduction by W. W. Bauer, M.D., Director, Bureau of Health Education, American Medical Association. Cloth. $2.50. Pp. 125. Farrar, Straus and Cudahy, 101 Fifth Ave., New York 3; Ambassador Books, Ltd., Toronto, Canada, 1955.

Although it has been designed for the general public, many physicians may read this little book with profit. While much of the factual information—for example, the description of the various medical treatments that may be used with the alcoholic—will be familiar, there is much material that is likely to prove enlightening and helpful to those without specialized training or with limited practical experience in coping with the liquor addict. In this category may be included the sections dealing with Alcoholics Anonymous, the therapeutic role of religion, the psychological and physiological factors involved in pathological or compulsive drinking, the special problems of the female drinker, and the agencies and facilities that are available to aid the alcoholic. This book's strongest claim to attention, however, lies in the fact that it can be heartily recommended to the problem or borderline drinker as well as to his or her relative, employer, or friend—indeed, to everyone directly or indirectly concerned with the liquor problem. The drinker himself, who, incidentally, is urged to see his family physician first, will find sympathetic understanding, wise counsel, practical guidance, and real encouragement in the pages of this book. Relatives and others anxious to assist the drinker will gain a better appreciation of his difficulties, receive sensible down-to-earth advice on how to treat him and influence him to take the necessary steps toward overcoming his addiction, and learn just where to go for specific information or personal assistance. For those who simply wish to become better informed on the grim but fascinating and vital problems of alcoholism, a reading of this lucid, nontechnical book will provide a rewarding survey of its most important practical aspects. In meeting this need, this unpretentious book can do much good.

Diseases of the Ear, Nose, and Throat in Children. By T. G. Wilson, M.B., B.Ch., Litt. D., Ear, Nose, and Throat Surgeon, Dr. Steevens' Hospital, Dublin, Ireland. Cloth. $12. Pp. 307, with 145 illustrations by author. Grune & Stratton, Inc., 381 Fourth Ave., New York 16; 99 Great Russell St., London, W.C.1, England, 1955.

This textbook should be a welcome addition to the libraries of otolaryngologists and pediatricians. The character of otolaryngological practice has changed greatly during the past generation because of the advent of sulfonamides, antibiotics, and antihistaminic drugs, and this has brought with it fresh emphasis on congenital defects, infantile otitis media, defective hearing and speech, the auditory and vocal rehabilitation of deaf children, and infections of the respiratory tract. Within the domains of otology, the relatively new science of audiology has developed. Readers of this book should find the chapters on congenital abnormalities of the ear, nose, face, esophagus, and lower respiratory tract useful and the chapters on deafness in childhood, the training and education of deaf children, defective speech in childhood, and thyroglossal cysts and fistulas informative. This book is highly recommended.

Pathology. By Peter A. Herbut, M.D., Professor of Pathology, Jefferson Medical College, Philadelphia. Cloth. $16. Pp. 1227, with 1378 illustrations. Lea & Febiger, 600 S. Washington Sq., Philadelphia 6, 1955.

Professor Herbut states in the introduction to this book that it is intended for "the student of medicine—be he undergraduate or postgraduate" and indicates the general plan of the book. First, there is a brief survey of general pathology and then a full and systematic consideration of special pathology. The chapters in the latter section reflect the author's great interest in surgical pathology. All the important lesions and many unimportant ones are carefully described and illustrated. The book retells the traditional story of pathology from the familiar point of view of morbid anatomy, but pathology can be considered from other points of view, and of these the book makes little mention. Scant consideration is given to the mechanisms by which the lesions have been brought about, and there is only a small effort to explain them in terms of biochemical or biophysical alterations. The relative space devoted to general pathology and special pathology, which is in the ratio of about 1:10, seems disproportionate, and as a consequence the student is given only a bare description of the tissue changes and a list of the causes of such important phenomena as inflammation, degenerations, and tumors. Similarly in the chapters on special pathology little mention is made of the functional changes that accompany the anatomic changes. To illustrate, there is no discussion of abnormal liver or kidney function, although the morphological aspects of diseases of the liver and kidney are discussed in detail. The student who is willing to make allowances for these omissions will find the book a helpful guide to the identification of the evidences of disease that he will observe in the autopsy room and the laboratory of surgical pathology.

These book reviews have been prepared by competent authorities but do not represent the opinions of any medical or other organization unless specifically so stated.

QUERIES AND MINOR NOTES

PAIN RELIEF DURING LABOR

To the Editor:—*A pregnant woman, who was a heroin addict, has been free of the addiction for 18 months. She is fearful of any pain-relieving medication during labor because of the possibility of renewing the drug habit. Is there any reason for concern if pain-relieving drugs are used sparingly during labor? If not, what about the use of barbiturates?*

M.D., New York.

This inquiry was referred to two consultants whose respective replies follow.—Ed.

Answer.—The patient well should fear renewal of her addiction if narcotics are used in labor. She should first be encouraged to believe she may need little or nothing in labor for relief of pain. Such methods employed by Grantly Dick Read, or even hypnosis if that is available may be helpful. To go through a labor without narcotics would strengthen her psychic resistance following her addiction. If these methods fail or are not available, barbiturates or any of the sedative nonnarcotic drugs may be used. Some obstetricians are using inhalant gas with considerable success.

One suggestion that may be helpful is the use of the new drug thorazine or chlorpromazine hydrochloride. When this drug is used, the dose of sedatives may be cut in half; in fact, one must use care in the dosage of any sedatives when this drug is used, because it enhances the effect so much one may oversedate the patient. When the second stage is reached, gas may be used, if necessary.

Answer.—There is no need to be concerned about the possibility of therapeutic use of pain-relieving drugs leading to relapse to opiate addiction, more particularly since the size of the doses used would be quite small. Addicts practically never relapse as a result of receiving analgesics postoperatively. Relapse is usually traceable to the same psychological and environmental factors initially responsible for the addiction. The same considerations apply to the use of barbiturates. If the patient insists on receiving no analgesics, small amounts of scopolamine might be tried. The use of some kind of regional anesthesia such as caudal analgesia might also be considered.

COMPLICATION OF PROLONGED CORTISONE TREATMENT

To the Editor:—*A 42-year-old white woman had been treated for severe arthritis for the past four years with cortisone, 25 to 50 mg. daily, and then she was referred to our clinic for a routine chest x-ray, which showed a massive pleural effusion in the left side of the chest. After aspirating the greater portion of this empyema, which was pea-green in color and very thick, we noted that there was no definite evidence of any parenchymal lesion that may have caused this empyema. There was no history of any previous pneumonia. A Mantoux test was negative, and the pus was negative for tubercle bacilli. Other examinations failed to reveal the cause of this empyema. Could a pleural empyema be caused by prolonged administration of cortisone?* *Louis Levin, M.D., Pontiac, Ill.*

Answer.—The case described presents one of the not uncommon and most distressing complications of prolonged cortisone treatment. The masking of the symptoms of an infectious process by cortisone administration has frequently been observed. In experimental animal and in humans it has been demonstrated that infections with organisms usually considered to be nonpathogenic or of very low virulence may occur when cortisone is administered in high dosage or over a long period of time. Preexisting infectious foci, particularly those of tuberculous etiology may flare up and produce a widespread systemic infection with minimal symptomatology under the influence of cortisone administration. Systemic infection with fungi ordinarily considered nonpathogenic have been reported in patients receiving cortisone. The reasons for this enhancement of susceptibility to infection seen in patients receiving cortisone (or other adrenal steroid) therapy are not entirely clear. Experimentally it can be shown that large doses of adrenal steroids may attenuate the immune processes that combat infection. It is also known that large doses of adrenal steroids may inhibit the repair processes of the body. In the case in question it would seem reasonable to postulate that the patient's resistance to infection was lowered by the chronic administration of cortisone with the consequent production of the empyema. Microscopic examination and culture of the pus for fungi such as Candida (Monilia) or Histoplasma capsulatum may help to establish the cause of this infection.

HEMOIRRADIATION

To the Editor:—*I received a letter about a patient who received irradiated blood by an instrument called a Knott hemoirradiator for myocardial infarction. The physician giving this treatment claims it is an accepted form of therapy in a number of medical conditions and quoted an extensive bibliography. I am not familiar with this instrument and would appreciate any information that you may give me as to its clinical usage, especially in coronary artery disease.*

Alexander A. Doerner, M.D., San Francisco.

Answer.—The Knott hemoirradiator is an apparatus that is employed to expose blood drawn from a patient to ultra violet light. This blood, presumed to have been modified by such exposure, is then returned to the patient as a therapeutic measure. This technique has been employed in a wide variety of diseases in which results are difficult to evaluate because of the inherent variability in the natural history of these disorders, e. g., biliary tract disease and pelvic cellulitis. Under such circumstances a protagonist could make a case for "benefit" from such therapy. It is, however, the general consensus that hemoirradiation by ultra violet light has not been demonstrated to be either on a firm theoretical, experimental, or clinical basis. The use of this technique for coronary artery disease is advocated by none of the authorities in this field throughout the country.

HEADACHES FROM DYNAMITE

To the Editor:—*A 35-year-old married man, in the course of his work, has occasion to handle dynamite. After handling the material, with his hands gloved, he invariably develops a violent headache. Furthermore, he tells me that the same type of headache will occur from merely wearing the gloves used in handling the dynamite, even though several weeks may elapse. I would appreciate an explanation of this phenomenon.* *Carl Stein, M.D., Loudonville, Ohio.*

Answer.—Nitroglycerin is readily absorbed through the human skin, if it comes in contact with the skin as from wearing "powder-contaminated" gloves. If the air contains nitroglycerin and similar nitrobodies, absorption by the lungs may add to the amount entering the body. The resulting dilation of cerebral blood vessels is presumably the mechanism of the nitrite headache. Rubber-impregnated gloves are sufficiently impervious to nitroglycerin to afford protection. These must be laundered in alkaline solutions daily or after each use to prevent their becoming a source of the drug (by contamination inside the glove).

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any medical or other organization unless specifically so stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.
